Key to Document Status Codes

- Work in Progress** An incomplete document, designed to guide discussion and generate feedback that may include several alternative requirements for consideration.
- Draft** A document in specification format considered largely complete, but lacking review by Members and vendors. Drafts are susceptible to substantial change during the review process.
- Issued** A generally public document that has undergone Member and Technology Supplier review, cross-vendor interoperability, and is for Certification testing if applicable. Issued Specifications are subject to the Engineering Change Process.
- Closed** A static document, reviewed, tested, validated, and closed to further engineering change requests to the specification through CableLabs.

1 INTRODUCTION

Comcast Corporation, Time Warner Cable, and Bright House Networks collaborated to develop the interoperability requirements to support business services products using Ethernet Passive Optical Network (EPON) as an access technology.

DOCSIS Provisioning of EPON (DPoE) is a joint effort of operators, vendors, and suppliers to support EPON technology using existing DOCSIS-based back office systems and processes.

Ethernet PON or EPON is an [802.3] standard for a passive optical network (PON). A PON is a specific type of multi-access optical network. A multi-access optical network is an optical fiber based network technology that permits more than two network elements to transmit and receive on the same fiber. Appendix I in [DPoE-SP-ARCHv1.0] has a more detailed explanation of multi-access optical networks.

This version of the DPoE specifications is focused on DOCSIS-based provisioning and operations of Internet Protocol (IP) using DOCSIS High Speed Data (HSD), or IP(HSD) for short, and Metro Ethernet Forum (MEF) services. DPoE Networks offer IP(HSD) services functionally equivalent to DOCSIS networks, where the DPoE System acts like a DOCSIS CMTS and the DPoE System and DPoE Optical Network Unit (ONU) to appear to act like a DOCSIS CM.

1.1 DPoE Technology Introduction

DPoE technology was established with the following common requirements already developed by operators. Each of the participant operators had previously selected 1G-EPON and 10G-EPON as the appropriate technology for one or more applications. EPON is a widely-deployed technology with a sufficient and large supply of vendors offering a variety of products for each component of the access network. 10G-EPON technology is now becoming available and is backwards compatible with 1G-EPON. A 1G-EPON network can be incrementally upgraded to 10G-EPON, adding or replacing ONUs one at a time if required. 1G-EPON and 10G-EPON are compatible with [SCTE 174], Radio Frequency over Glass (RFoG).

The EPON protocol [802.3ah] and the amendment for 10G-EPON [802.3av] support a centralized Optical Line Termination (OLT) architecture with low cost Layer 2 access devices (ONU). The basic service mapping architecture in EPON is to map Ethernet (or IP) frame header information (such as addresses, IP DiffServ Code Points, Ethernet Q tag, S-VLAN/C-VLAN ID, I-SID, bridge address, or other marking) to a logical circuit called a Logical Link Identifier (LLID) in [802.3ah]. The service function is similar to that used in DOCSIS networks in many ways because it is based on a centralized scheduler and uses an LLID which functions like an SID, supports both unicast and broadcast, and has other similarities.

Existing [802.3ah] EPON systems do interoperate within the strict definitions of 1G-EPON. Experience with lab testing, field trials, and deployments has shown operators that 1G-EPON OLT and ONU systems typically only interoperate with a single port ONU. This is because [802.3ah] specifies the interfaces on the PON (the DPoE TU interface) but does not specify any of the other system interfaces. For example, an OLT from vendor A will register an ONU from vendor B, but it is not possible to construct a VLAN from the DPoE MN interface to an S interface. This is a well-recognized limitation of [802.3ah]. The challenge is that neither 1G-EPON nor 10G-EPON specify Operations Administration Maintenance and Provisioning (OAMP) to forward traffic between Network to Network Interface (NNI) ports and the PON, or User Network Interface (UNI) ports and the PON. This is not different from other Ethernet standards. For example, if two Ethernet switches from two different vendors are connected, each switch must typically be configured independently. The challenge for EPON is that the remote device (the ONU) cannot be reached, and therefore cannot be configured. A solution to this problem must then be based on developing a common (standard) method of reaching the controller for the ONU, identifying the ONU capabilities, and providing that information to the OLT so that it can configure a working end to forwarding service (in both directions).

Even if EPON had solved that provisioning challenge, there are no standard management interfaces for the ongoing operations and maintenance of the network, including fault management, performance management, security, etc. Operators already have fully working and scaled-out systems that solve these challenges for DOCSIS networks. One of the primary goals for DPoE specifications is to use the existing DOCSIS back office infrastructure to scale up EPON-based business services.

1.2 Scope

This document identifies requirements for the IP network element operation, administration, maintenance, provisioning, forwarding, and signaling for DPoE System NNI interfaces. The scope is limited to the interfaces required for the DPoE System element and excludes those interfaces already specified elsewhere in [DOCSIS], DPoE specifications, Packet Cable, or Packet Cable Multimedia. This version of the specification does not include requirements for IPv6 or multicast.

The forwarding and signaling requirements are a subset of the D and MN interfaces requirements. In addition to this specification, D and MN requirements are specified in [DPoE-SP-MULPIv1.0] and [DPoE-SP-OSSIV1.0].

Requirements for some interfaces may use the same protocols as those protocols used in the other DPoE specifications, but do not overlap. For example, this document specifies additional SNMP requirements that are not specified in [DPoE-SP-OSSIV1.0] for IP routing and other functions not addressed by [DOCSIS] which [DPoE-SP-OSSIV1.0] loosely mirrors.

IP NE requirements include IEEE Ethernet protocol, IETF protocol, and non-standard Command Line Interface (CLI) or other functional requirements.

Most of the NE requirements are independent of specific services. The common requirement for all of the NNIs is [802.1Qaz]. In particular these interfaces require most Ethernet link layer and Media Access Control (MAC) layer services. The interfaces are not exclusive of each other. Although MEF and Ethernet services will be delivered over a Layer 2 NNI, IP services and IP OAMP operate over a converged IP router function across one or more address spaces. Therefore, the scope of the IP Network Element requirements includes IP routing functions identical to those in CMTS systems deployed by operators today. The IP requirements can be converged with the Layer 2 requirements either by the use of separate interfaces or of by combining the D and MN interfaces as sub-interfaces on a trunked Ethernet physical link or a trunked Ethernet logical link formed by link aggregation across multiple physical Ethernet interfaces.

1.3 Goals

Collectively, the operators started the DPoE specification development to accomplish the following objectives:

- Identify and document the common requirements for triple play services for business customers over EPON.
- Adapt DOCSIS-based back office provisioning and operations models to EPON. This is the core objective of DPoE specifications.
- Develop consensus on additional requirements above and beyond DOCSIS specifications to take advantage of the capabilities of EPON. These are focused in the area of Ethernet services and MEF integration.
- Continue to leverage the supply chain and economic benefits of a large base of suppliers and high-volume supply chain in optics, subsystems, and network systems based on a commodity EPON technology. Doing so requires adapting operator processes and networks to the EPON system rather than making any changes to the EPON systems.
- Position DPoE specifications to continue to leverage those same benefits for 10G-EPON.
- Work with the established EPON vendor community to assure that these strategies can be effective to mutually develop DPoE Networks, and to create a marketplace for success for multiple vendors to provide solutions for the variety of needs within the operator environment.

1.4 Requirements

Throughout this document, the words that are used to define the significance of particular requirements are capitalized. These words are:

"MUST"	This word means that the item is an absolute requirement of this specification.
"MUST NOT"	This phrase means that the item is an absolute prohibition of this specification.
"SHOULD"	This word means that there may exist valid reasons in particular circumstances to ignore this item, but the full implications should be understood and the case carefully weighed before choosing a different course.
"SHOULD NOT"	This phrase means that there may exist valid reasons in particular circumstances when the listed behavior is acceptable or even useful, but the full implications should be understood and the case carefully weighed before implementing any behavior described with this label.
"MAY"	This word means that this item is truly optional. One vendor may choose to include the item because a particular marketplace requires it or because it enhances the product, for example; another vendor may omit the same item.

1.5 Organization of Specifications

The DPoE specifications are organized around existing DOCSIS specifications. The purpose of matching DPoE specification documents to existing CableLabs DOCSIS, IEEE, IETF, and MEF requirements is to facilitate the mapping of services from existing DOCSIS infrastructure to DPoE infrastructure, and to provide an organization that will be easy to maintain as related (referenced) standards, recommendations, or specifications undergo independent changes.

There are two types of documents in the DPoE specifications. The first includes informative and requirements documents called specifications that detail the specific requirements for products claiming compliance with the specifications. The DPoE specifications also include a new kind of document that does not fit into any of the above categories. The IP Network Elements (IP NE) Requirements are a set of common requirements for the management of IP network elements that operators have developed, which are above and beyond the requirements in DOCSIS specifications, but are nonetheless required in DOCSIS CMTS products today. These are not specifications because no new protocols or algorithms are provided. Most of the requirements in IP NE are existing requirements based on IEEE, IETF, or other network management standards.

The DPoE documents are detailed in Section 1.6 of this document and duplicated, for reference, in each of the DPoE specifications.

1.6 DPoE Specifications

This document is one in a series of nine (9) documents comprising the DPoE specifications. Collectively these documents represent the operators' requirements for EPON-based commercial services.

Table 1 - DPoE Specifications

Document	Document Title	Description
DPoE-SP-ARCHv1.0	DPoE Architecture Specification	DOCSIS Provisioning of EPON introduction, architecture, and narrative. Specifies fundamental architectural requirements (those that apply to more than one specification). Explains the purpose of each document below.
DPoE-SP-OAMv1.0	DPoE OAM Extensions Specification	Extensions beyond [802.3ah] and [802.3av] requirements.
DPoE-SP-PHYv1.0	DPoE Physical Layer Specification	Using the EPON PHY, the DPoE PHY specification makes mandatory some options within EPON and adds some additional requirements.
DPoE-SP-SECv1.0	DPoE Security and Certificate Specification	Specifications for support for DOCSIS network and system interfaces to provide transparent support of DOCSIS device authentication, code verification, and additional security for a DPoE implementation.
DPoE-SP-IPNEv1.0	DPoE IP Network Element Requirements	Best practices and operator requirements for IP network element management and operations. This document includes CMTS-like IP router requirements. This document recommends practices not currently covered by any existing DOCSIS specifications.
DPoE-SP-MULPIv1.0	DPoE MAC and Upper Layer Protocols Requirements	Specifications for support of a subset of DOCSIS 3.0 MULPI functionality with additional EPON requirements.
DPoE-SP-MEFv1.0	DPoE Metro Ethernet Forum Specification	Specifications for Metro Ethernet services added to DOCSIS static configuration provisioning model.
DPoE-SP-OSSIv1.0	DPoE Operations and Support System Interface Specification	Specifications for support of a subset of DOCSIS 3.0 OSSI functionality with additional EPON requirements.
DPoE-SP-DEMARCv1.0	DPoE Demarcation Device Specification	Specifications to support the DEMARC Auto-Configuration process to discover and provision a demarcation device connected to a DPoE ONU.

1.8 DPoE Interfaces and Reference Points

The DPoE interfaces and reference points provide a basis for the description and enumeration of DPoE specifications for the DPoE architecture. Each interface or reference point indicates a point between separate sub-systems. The reference points have protocols that run across them, or have a common format of bearer traffic (with no signaling protocol). All of the interfaces are bi-directional interfaces that support two-way communications. The protocols in DPoE specifications operate within different layers based on the [802.3], [802.1], IETF, MEF, and CableLabs specifications. The C reference points are uni-directional for upstream (C_0) or downstream (C_S) classification, respectively.

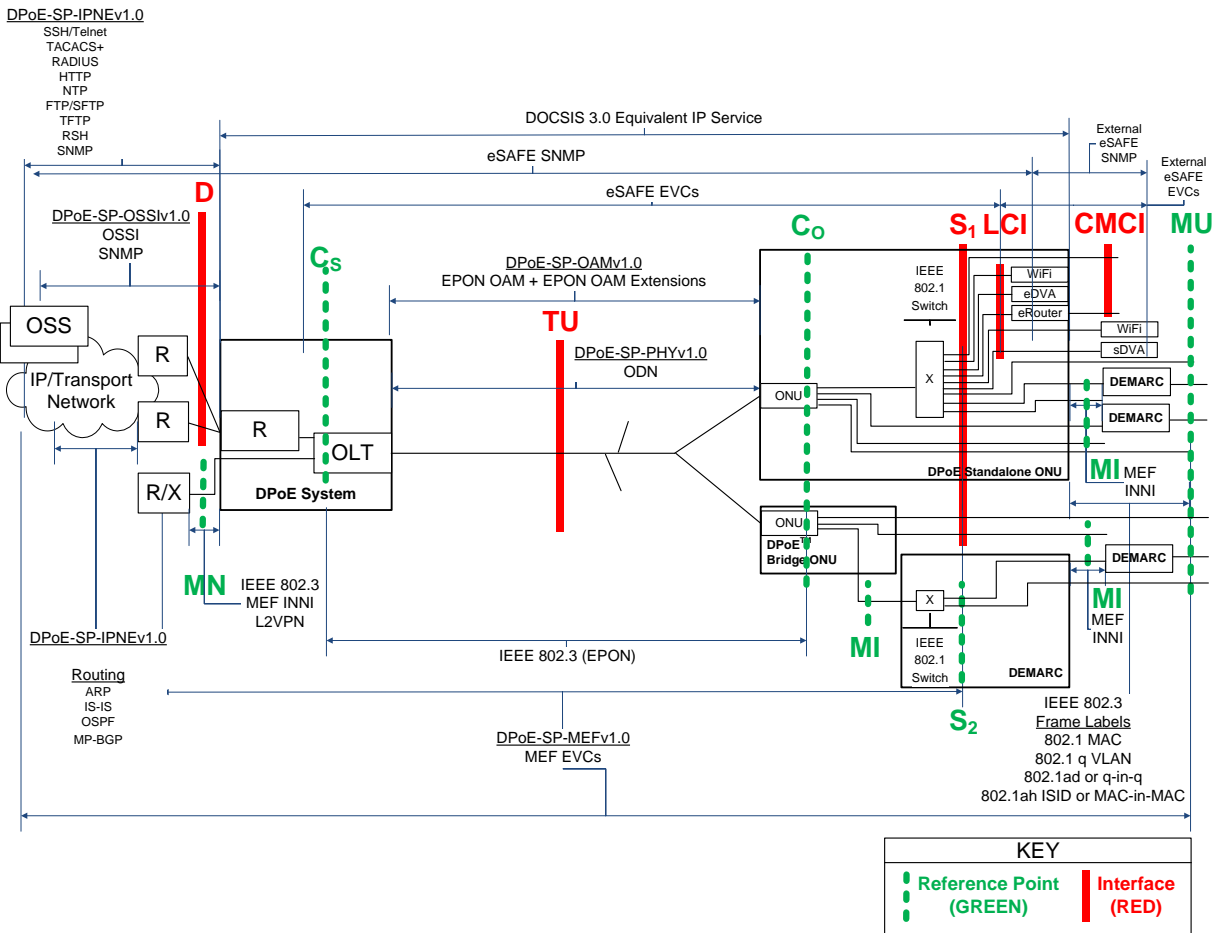

Figure 2 - DPoE Interfaces and Reference Points

Table 2 - DPoE Interface and Reference Point Descriptions

Interface or Reference Point		Interface or Reference Point Description
MN		The MN interface is an [802.3] interface for Ethernet (or MEF or [L2VPN] emulated) services only. It serves the role of a MEF INNI or L2VPN NSI. It is an NNI for Metro Ethernet services only.
D		The D interface is the DOCSIS IP NNI interface. It is an operator network facing interface, sometimes called a Network to Network Interface (NNI) or Network Systems Interface (NSI) in DOCSIS specifications. The D interface allows a DPoE System to communicate with an IP network. The D interface carries all IP management traffic including OSSI and IP NE traffic. The D interface carries all DOCSIS IP service traffic.
TU		The TU interface is a short form of expressing the interface between the DPoE System and the DPoE ONU.
C		The C reference point is used for explanation of traffic ingress to a DPoE classifier.
	C _O	The C _O reference point is used for explanation of traffic ingress to a DPoE ONU upstream classifier.
	C _S	The C _S reference point is used for explanation of traffic ingress to a DPoE System downstream classifier.
S		The S interface is an IEEE 802 interface. The S interface may be an internal interface (such as [802.3] across a GMII SERDES or XGMII interface in an SFP-ONU, SFP+ONU, or XFP-ONU) or it may be an external Ethernet interface. S ₁ is an interface for a DPoE Standalone ONU. S ₂ is a reference point used for explanation of services with the DPoE Bridge ONU.
	S ₁	The S ₁ interfaces are the general case of all interfaces on a DPoE Standalone ONU. S ₁ interfaces may be CMCI, LCI, MI, or MU interfaces.
	S ₂	The S ₂ reference point is used for explanation of traffic ingress to and egress from interfaces on a DEMARC device in a DPoE System. Although there are no specifications or requirements for the S ₂ reference point, informative text refers to the S ₂ reference point to provide the full context for the use of a DPoE Bridge ONU in a DEMARC device providing Metro Ethernet services.
LCI		The Logical CPE Interface (LCI) interface is an eDOCSIS interface as defined in [eDOCSIS]. The eDOCSIS architecture is [802.1d] MAC-based according to the DOCSIS 3.0 specifications; however, DOCSIS L2VPN clearly supports [802.1q] switching. In practice, therefore, the eDOCSIS interface consists of a DOCSIS classifier and [802.1] switch as illustrated. The function of a DOCSIS classifier is in part replaced by forwarding (tagging and encapsulation) in MEF and in part covered by classifiers in [DPoE-SP-MULPIv1.0].
CMCI		CMCI is the DPoE interface equivalent of the DOCSIS Cable Modem CPE Interface as defined in [CMCIv3.0]. This is the service interface for DOCSIS-based IP services.
MI		MI is usually an S interface (or S reference point) that operates as a MEF INNI. A DPoE ONU that provides a MEF INNI has an MI interface. A DPoE ONU can have MU as an interface and an MI reference point on different S interfaces in a single DPoE ONU. The MI interface or reference point is an [802.3] interface (or reference point) between a DPoE ONU and a DEMARC device.
MU		MU is usually an S interface (or S reference point) that operates as a MEF UNI. A DPoE ONU that directly provides a MEF UNI (MU) interface has MU as an interface. A DPoE ONU can have MU as an interface and an MI reference point on different S interfaces in a single DPoE ONU. The MU interface or reference point is an [802.3] interface (or reference point) between a DPoE ONU or a DEMARC device and a customer's equipment.

2 REFERENCES

2.1 Normative References

In order to claim compliance with this specification, it is necessary to conform to the following standards and other works as indicated, in addition to the other requirements of this specification. Notwithstanding, intellectual property rights may be required to use or implement such normative references. At the time of publication, the editions indicated were valid. All references are subject to revision, and users of this document are encouraged to investigate the possibility of applying the most recent editions of the documents listed below. References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific. For a non-specific reference, the latest version applies.

3 TERMS AND DEFINITIONS

3.1 DPoE Network Elements

DPoE Network	This term means the entire network described in Figure 3 from the D or MN interface to the LCI, S, MI, or MU interface (see Figure 2 for interface and reference points), depending on the service being described. In no case does the term DPoE Network ever include a DEMARC device.
DPoE System	This term means all of the collected elements that provide the DPoE function within the operator's network facilities. This includes the EPON OLT function, DOCSIS service functions required for the D interface, Metro Ethernet service functions required for the MN interface, and IP NE element management, routing and forwarding functions specified in this specification. The DPoE System is depicted in Figure 3.
DPoE ONU	This term means a DPoE-capable ONU that complies with all of the DPoE specifications. There are two types of DPoE ONUs. These are the DPoE Standalone ONU and the DPoE Bridge ONU.
DPoE Standalone ONU	This term means a DPoE ONU that is a standalone ONU capable of providing IP or Ethernet services directly to customer premise equipment or transport of traffic to an external DEMARC device.
DPoE Bridge ONU	This term means a DPoE ONU that is capable of [802.1] forwarding but cannot do all of the encapsulation functions required to be a DPoE Standalone ONU. Examples include an SFP-ONU and some simple EPON chipset-only based ONUs.
DEMARC	Short form of "Demarcation Device." This term means the device, owned and operated by the operator that provides the demarcation (sometimes called the UNI interface) to the customer. Some architecture describes this device as the CPE (as in DOCSIS, DSL, or Broadband Forum Models) or the NID (as in the MEF model).

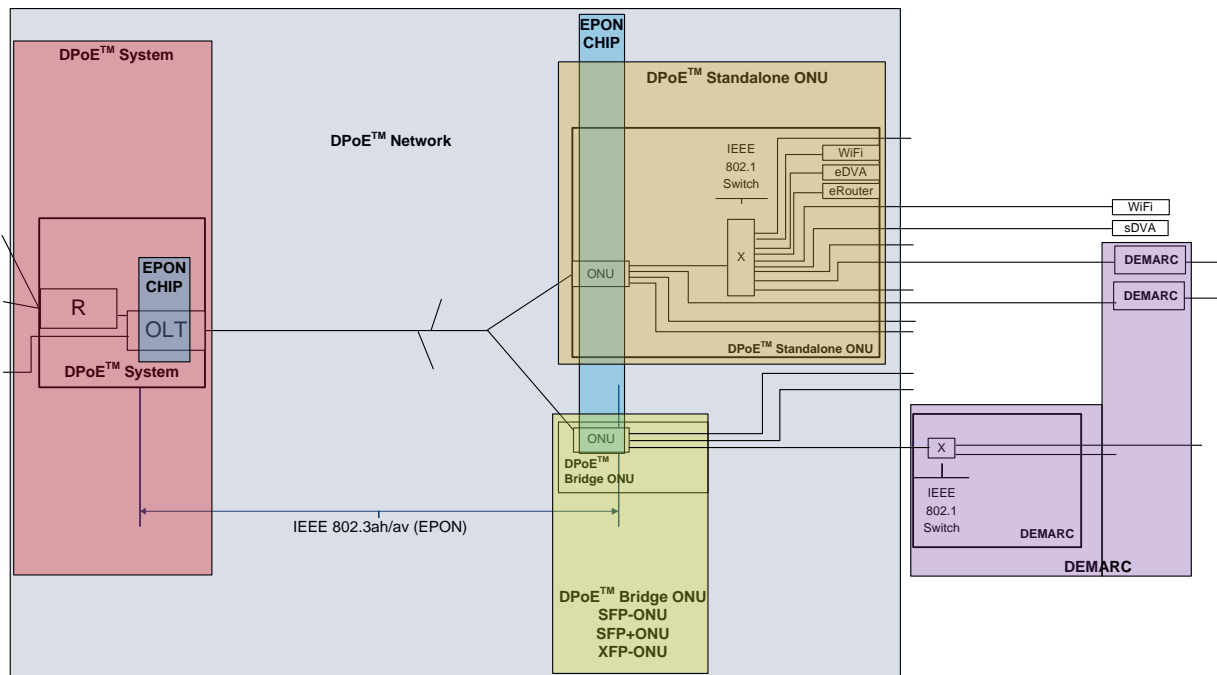

Figure 3 - DPoE Network Elements

4 ABBREVIATIONS AND ACRONYMS

This specification uses the following abbreviations:

1G-EPON	EPON as defined in [802.3ah]
10G-EPON	EPON as defined in [802.3ah] and amended in [802.3av]
ACL	Access Control Lists
ARP	Address Resolution Protocol
BFD	Bi-directional Forwarding Detection
CFM	Connectivity Fault Management
CLI	Command Line Interface
CM	Cable Modem
CMCI	Cable Modem CPE Interface
CMTS	Cable Modem Termination System
CPE	Customer Premise Equipment
CoS	Class of Service
DSCP	Diff-Serv Code Point
DPoE	DOCSIS Provisioning of EPON
DR	Default Router
EACL	Extended Access Control Lists
eCM	embedded Cable Modem
ECMP	Equal Cost Multi-path
IEEE	Institute of Electrical and Electronics Engineers
IETF	Internet Engineering Task Force
EPON	Ethernet Passive Optical Network
eSAFE	embedded Service/Application Functional Entity
FTP	File Transfer Protocol
HSD	High Speed Data
Gbps	Gigabits per second (as used in the industry)
IGP	Interior Gateway Protocols
IP(HSD)	High Speed Data (Broadband Internet Access using DOCSIS)
INNI	Internal Network to Network Interface
IP	Internet Protocol
IP-SG	IP Serving Group
I-SID	[802.1ah] I-Component Service Identifier
LCI	Logical CPE Interface
LDP	Label Distribution Protocol
LLID	Logical Link Identifier
LOM	Lights Out Management
LSA	Link State Advertisement
MAC	Media Access Control
MEF	Metro Ethernet Forum
MEN	Metro Ethernet Network

MI	MEF INNI Interface at a customer premise
MLS	Multi-Layer Switching
MN	MEF INNI Interface to operators MEN
MOTD	Message Of The Day
MPLS	Multi-protocol Label Switching
MSA	Multi-source Agreement
MU	MEF UNI Interface
NE	Network Elements
NEBS	Network Equipment Building Standard
NID	Network Interface Device
NNI	Network to Network Interface
OAM	EPON Operations Administration and Maintenance
OAMP	Operations Administration Maintenance and Provisioning
ODN	Optical Distribution Network
OLT	Optical Line Termination
ONU	Optical Network Unit
OSC	Optical Splitter Combiner
PB	Provider Bridging [802.1ad]
PBB	Provider Backbone Bridging [802.1ah]
PHY	Physical Layer
PON	Passive Optical Network
PPP	Point to Point Protocol
QoS	Quality of Service
RADIUS	Remote Authentication Dial In User Service
RFoG	Radio Frequency over Glass
RIP	Routing Information Protocol
sDVA	Standalone Digital Voice Adapter
SFP	Small Form-factor Pluggable
SFP+	Small Form-factor Pluggable Plus (+)
SLARP	Serial Line Address Resolution Protocol
SLIP	Serial Line Internet Protocol
TOS	Terms of Service
TACACS+	Terminal Access Controller Access-Control System Plus
TPID	Tag Protocol Identifier
ULL	Underwriter Laboratory Listing
UNI	User Network Interface
UTC	Coordinated Universal Time
vCM	Virtual Cable Modem
VLAN	Virtual Local Area Network
VLSM	Variable Length Subnet Masking
X	IEEE Ethernet Switch (Generic)
XFP	X Form-factor Pluggable

5 IP NE FUNCTIONS (INFORMATIVE)

Existing [DOCSIS] based CMTS have a number of functions that are necessary which are not specified or explained in the [DOCSIS] or DPoE Specifications. This section provides the rationale and description of the functions required by CMTS and DPoE Systems.

The [DOCSIS] specifications provide a standard set of methods for the interoperability of Cable Modems (CM) and Cable Modem Termination Systems (CMTS). These methods require standard interfaces and capabilities for the DOCSIS RF interfaces and the operations, administration, maintenance, and provisioning of CMs to that any operator's systems and any CMTS can operate any CM. DOCSIS has proven to be very effective for multi-vendor CM interoperability across multiple operators and multiple CMTS vendors.

The [DOCSIS] specifications do contain requirements for some aspects of CMTS OAMP. These are focused primarily on the interoperability described above. However, [DOCSIS] requirements are silent on the forwarding and signaling architecture for both Ethernet and IP NNI interface that connects the CMTS to the operator's Ethernet and IP networks. [DOCSIS] also provides some minimal requirements for the management of the CMTS entity, but is again silent on entity requirements such as the IP address of the element itself, security, and access to the element itself, etc.

In lieu of specifications for the CMTS, operators have, over their years of experience, developed product requirements for their CMTS vendors. This document collects the requirements from the participating operators and provides a single document as a baseline for the requirements for CMTS that will apply to DPoE Systems.

Although the operators do have requirements for IPv6 for CMTS, this document does not identify IPv6 requirements for DPoE Systems because they are not included in the scope of this version of the DPoE specifications.

6 DPOE SYSTEM IP NE REQUIREMENTS

Despite the extensive detail for the configuration of Cable Modems, DOCSIS specifications do not describe the configuration of the CMTS. Like DOCSIS, the other DPoE specifications are focused on the Operations, Administration, Maintenance, and Provisioning of DPoE ONUs. DOCSIS and the other DPoE specifications identify requirements for the CMTS and DPoE System (respectively) but do not specify methods of provisioning the CMTS and DPoE System. This document specifies only those (missing) requirements not otherwise specified.

6.1 Network Element Access Methods and Operations

6.1.1 Command Line Interface¹

The DPoE System **MUST** have a Command Line Interface (CLI). The DPoE System **MUST** have a serial port terminal for the management and operation of the complete DPoE System. The DPoE System **MUST** make the CLI accessible from a serial port terminal and from configurable IP loopback addresses using the SSH2 protocol. The DPoE System CLI is expected to be identical CLI whether accessed via terminal / serial interface or IP via SSH2 or telnet. The DPoE System **MUST** have the capability to support Access Control Lists (ACLs) and Extended Access Control Lists (EACLs) to limit the connection of clients to the SSH2 daemon by source IP address.

The DPoE System CLI is expected to provide a structured command syntax format for input and output in order to support scripting.

The DPoE System CLI **MUST** provide context sensitive help. The DPoE System **SHOULD** provide command interactive command completion using the ASCII TAB character when the existing portion of an entered command is unique and can be completed without further information typed, sent or read into the CLI parser.

The DPoE System CLI **MUST** support a configurable idle-timer to automatically log off clients connected via serial ports locally or remotely over IP after the configured period of time.

The DPoE System CLI **MUST** provide a capability to list all clients connected to the CLI (by any means available). The DPoE System CLI **MUST** provide a method to disconnect selected clients connected to the CLI from the CLI.

The DPoE System CLI prompt **MUST** be operator configurable from the CLI and from the configuration file.

The DPoE System **MUST** support CLI access from any means for at least four (4) sessions simultaneously. The DPoE System **MUST** support simultaneous access for users with different privileges. The DPoE System **MUST** allow at least four (4) simultaneous CLI users to enter an active configuration mode simultaneously and enter real-time configuration changes or make changes to a configuration file. The DPoE System **MUST** inform each connected CLI user that another user has connected to the CLI or been disconnected from the CLI. The DPoE System **MUST** inform each connected CLI user that another user has entered a configuration mode when in the CLI.

6.1.2 Terminal Access²

The DPoE System **MUST** support VT100 terminal access via serial port with RJ-45 or RS-232 connectors to the CLI. The DPoE System terminal access **MUST NOT** require the use of IP addresses, Serial Line Internet Protocol (SLIP), or Point to Point Protocol (PPP).

The DPoE System terminal access **MUST** provide access to the entire DPoE System. The DPoE System **MAY** have more than one port for terminal access. If the DPoE System has more than one port for terminal access, all terminal access ports are expected to provide identical functionality.

¹ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

² Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

6.1.3 Lights Out Management

The DPoE System MAY provide Ethernet-based Lights Out Management (LOM) interface which may use Serial Line Address Resolution Protocol (SLARP), SLIP, PPP, or other means of automatic IP address and IP network configuration to provide console or terminal access.

The DPoE System Lights Out Management (LOM) access MUST provide access to all of the hardware in the DPoE System. The DPoE System MAY have more than one port for LOM. If the DPoE System has more than one LOM port, all LOM ports MUST provide identical functionality.

6.1.4 Secure Login³

The DPoE System MUST support non-encrypted password access via Telnet if configured.

The DPoE System MUST support MD5 encrypted storage of passwords for CLI access (by any means) if configured.

The DPoE System MUST support encrypted password access via SSH2 if configured.

The DPoE System MUST support Remote Authentication Dial In User Service (RADIUS) for password authentication if configured.

The DPoE System MUST support Terminal Access Controller Access-Control System Plus (TACACS+) for password authentication if configured.

The DPoE System MUST support at least two operating RADIUS or two operating TACACS+ servers. At any time, only one of operating authentication servers is expected to be active. The DPoE System is expected to be able to forward authentication requests to the currently active authentication server. The details of how DPoE System tracks authentication server status and selects the authentication server to send authentication requests to are outside the scope of this specification.

The DPoE System MUST provide a local method for password recovery for passwords stored on the DPoE System. The DPoE System LOM or serial port MUST allow access to the password recovery method. The DPoE System MUST NOT allow access to the password recovery method over the D, MN, or TU interfaces.

The DPoE System SHOULD provide a method to configure (from the CLI and in the configuration file) the DPoE System to limit access to each and every CLI command and each and every configuration command based on the type of secure login (SSH2, RADIUS, TACACS+, Telnet, or local), the operator name (username), and the time of day.

6.1.5 Client Applications

The DPoE System MUST support Telnet and SSH2 as a client. The DPoE System MUST allow the use of either target IP addresses or DNS names when acting as a client. The purpose of this functionality is to allow operators logged into a DPoE System to login to another system (DPoE System, CMTS, server, router, etc.) without logging out of the DPoE System.

The DPoE System MUST act as a DNS client. DNS client support is required for TCP/IP applications. For example, an operator might use ftp and want to designate the hostname using DNS rather than having to know the IP address. The DPoE System MUST be configurable to support at least two DNS servers configured by IP address in the configuration file.

The DPoE System MUST act as an NTP client. The DPoE System MUST be configurable to support at least two NTP servers configured by IP address in the configuration file.

³ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 and IPNEv1.0-N-12.0045-1 on 10/25/12 by JB.

6.1.6 Command Logging⁴

The DPoE System MUST log (if enabled) commands entered from any active CLI connection to a log file. Each DPoE System command log file entry MUST contain the exact command as entered, a time and date stamp, and the login identification used by the operator that entered the command.

The DPoE System MUST provide a means (in the configuration file and at the command line) to enable and disable command logging. The DPoE System MUST provide a means to limit the capability enable and disable command logging to specifically authorized operators based on the login identification.

The DPoE System MUST log (if enabled) commands entered from any active CLI connection to configured TACACS+ server. Each DPoE System TACACS+ command log entry MUST contain the exact command as entered, a time and date stamp, and the login identification used by the operator that entered the command.

The DPoE System SHOULD be capable of displaying entries from the command log, as described above; sorted by any combination of: login identification (name), date, and time.

The DPoE System MAY be capable of displaying entries from the command log, as described above; sorted or filtered by classes or categories of command as defined by the DPoE System vendor.

6.1.7 XML Management

The DPoE System MAY support XML-based management. The DPoE System MAY support XML-based management using:

- XML Configuration Files
- XML/SOAP over HTTP
- XML/SOAP over RSH
- XML with other access methods

If a DPoE System supports XML-based management, it SHOULD have a publicly published XML API using a well-known object architecture such as [NETCONF], custom SOAP objects, etc. A DPoE System that supports XML management and has an XML API SHOULD publish the API in the DPoE System documentation and have that same documentation available from the CLI.

6.1.8 SNMP⁵

The DPoE System MUST provide a unique text (string) description for the DPoE System in the object: system.sysDescr.0.

The DPoE System MUST provide a chassis serial number for each DPoE System chassis. The DPoE System serial number MUST NOT be operator configurable. The DPoE System MUST provide access to the chassis serial number for each chassis in the DPoE System by a MIB.

The DPoE System MUST support SNMPv2 MIBs specified in this document.

The DPoE System SHOULD support SNMPv3 MIBs specified in this document.

The DPoE System MUST support [RFC 2863] MIB II.

The DPoE System MUST support [RFC 4293] IP MIB for all IP interfaces (D and TU interfaces).

The DPoE System MUST support [RFC 4022] UDP MIB for all IP interfaces (D and TU interfaces).

The DPoE System MUST support [RFC 4113] TCP MIB for all IP interfaces (D and TU interfaces).

The DPoE System MUST support [RFC 2355] BGP4 MIB for DPoE System and D interface.

⁴ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

⁵ Revised per IPNEv1.0-N-12.0029-1 on 5/22/12 and per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

The DPoE System MUST support [RFC 4750] OSPF traps for the DPoE System and D interface.

The DPoE System MUST support [802.3] Ethernet MIBs for D interfaces.

The DPoE System MUST provide an industry standard or vendor-specific MIB to provide the following information:

- memory utilization
- CPU utilization
- hardware version for all DPoE System components that are modular (chassis, blades, servers, line cards, shelves, power supplies, etc.)
- firmware version for all DPoE System components that are modular (chassis, blades, servers, line cards, shelves, power supplies, etc.)
- software version for all DPoE System components that are modular (chassis, blades, servers, line cards, shelves, power supplies, etc.)
- fail over notifications for all redundant elements (processors, switches, fabrics, line cards, servers, ports, interfaces, power supplies, etc.)

The DPoE System MUST support at least two community strings for read-only (RO). The DPoE System MUST support at least two community strings for read-write (RW) that are distinct from the RO community strings.

The DPoE System SHOULD provide a method to separately limit or block each of both read and write access to MIB objects by OID based on the received community string for each SNMP message otherwise known as the view-based access control model for SNMP [RFC 2575].

The DPoE System MUST support at least two SNMP trap destination (servers or IP addresses).

The DPoE System SHOULD provide a method to individually enable and disable each possible trap required by this specification. The DPoE System SHOULD provide a method to assign a severity level for each possible trap.

6.2 Messages⁶

The DPoE System uses messages to all active login sessions to provide a method of notification to all active sessions. The DPoE System MUST provide a message to all active login sessions and create a matching local log entry for each of the following events: Configuration change is committed or saved.

- An interface is administratively configured up or down.
- A new session is started (logged in) or ended (logged out).
- An attempt to login fails.

The DPoE System SHOULD support the capability to configure the DPoE System to provide messages to all active login sessions and a matching local log entry for all configuration changes and state changes. The DPoE System MAY offer the capability to turn on or turn off specific verbose messaging and logging capabilities in addition to the all on or all off capability.

The DPoE System MUST provide a warning message to an active login session when that session enters an interactive configuration mode where changes entered can affect the configuration currently in use.

6.3 System Configuration File⁷

The DPoE System MUST provide a method for the transfer, storage, use, editing, and manipulation of a human-readable configuration file for the entire DPoE System as a single contiguous configuration file.

⁶ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

⁷ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

The DPoE System MAY use an XML format configuration file such as that described in [NETCONF]. The DPoE System SHOULD provide a method to designate a configuration file as the next active configuration file. The DPoE System SHOULD provide a separate method to activate the currently designated configuration file to load and run the system.

The DPoE System SHOULD provide a method for storage of a previous configuration (for roll-back or back-out) when configuration changes are made interactively or by file transfer.

The DPoE System SHOULD provide a complete revision control system for making, accepting, and providing comments on revision of configuration files such as RCS, SCCS, CVS, or similar tools.

The DPoE System SHOULD provide a method to compare the current (active) configuration and the immediate (previous) configuration, displaying the differences between the two files.

The DPoE System SHOULD provide a method to compare any two stored or saved configuration files, displaying the differences between the two files.

The DPoE System MUST provide a method to edit configuration files at the terminal of the device and over the SSH2 interface that is operable with a text based terminal or terminal window.

6.4 DPoE System Executable Software (Images)⁸

The DPoE System MUST operate as a single IP NE such that a single binary software image can be transferred to the system to provide the executable (binary) software image for the entire DPoE System.

The DPoE System image MUST be a monolithic system image for the entire DPoE System. The DPoE System executable (binary) software image MAY consist of various modules or other segments of code that the DPoE System can parse and use to manage the software of sub-systems within the DPoE System.

6.4.1 System Image Storage and Control

The storage capacity on the DPoE System is expected to be sufficient to store the active DPoE System executable software (image) currently running and at least two other versions of the software. This functionality is useful to allow the operator to roll-back or back-out the software to a previous version and download newer versions for software upgrades.

The DPoE System MUST have the capability for the operator to designate which of the available software images to load on the next reboot from among the available software images.

As part of the software release program, each published version of the DPoE System executable software (image) needs to include a separate file containing the corresponding MD5 hash computed against the executable image. The DPoE System MUST provide a command to read and compute an MD5 hash from the executable software (image) stored on the DPoE System and compare it to the corresponding MD5 key. The DPoE System MAY run this same executable software (image) file validation against an executable software (image) immediately before loading or running the image.

6.5 File Transfer

The DPoE System MUST support FTP and SFTP for the transfer of the binary software (as defined above) files, configuration files, and local log files (as defined above) to and from the DPoE System.

6.6 File Storage and Control⁹

The DPoE System SHOULD store configuration files in an ASCII formatted file.

⁸ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

⁹ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

6.6.1 Integrated¹⁰

The DPoE System **MUST** have integrated (or built-in) storage for configuration files, executable software (images) files, and local log files.

The DPoE System **MUST** have sufficient storage capacity to store the active DPoE System configuration file currently running and at least three other configurations for the DPoE System. This functionality is required in order to allow the operator to back-out the configuration to a previous configuration and download, edit, or create new configurations.

The DPoE System **SHOULD** have sufficient storage capacity to store the system configuration files as described above, all local logs, and any crash files, core dumps, or other diagnostic data. As described below, the size of the log files can be adjusted by operators to limit the space required for the potentially unbounded resource demands of logs.

The DPoE System **MUST** have the capability for the operator to designate which of the available configurations to run on the next reboot from among the available configurations.

6.6.2 Pluggable Storage

The DPoE System **SHOULD** support a pluggable storage medium capable of the same file storage and control as the integrated file storage and control described above. USB, PCMCIA Flash, Compact Flash, or other non-volatile memory could be used for such storage.

6.6.3 Local Log¹¹

The DPoE System uses local log as specified in [DPoE-SP-OSSv1.0]. The DPoE System **SHOULD** save the local log or a copy of the local log as an ASCII file.

6.7 Logs¹²

On the DPoE System there are requirements for log space to store vCM log events and requirements for log space to store DPoE System log events – hardware, software, and network interface failures – referred to as “platform logs”. The DPoE System **MUST** log all platform logs in a local log. The DPoE System **MUST** provide an option to store all platform logs in non-volatile memory in order to preserve log entries across system failures, administrative, or manual reboot or reloads.

The DPoE System **MUST** be configurable to log all debug messages into the “local log” for debugging functions that are configured or enabled (turned on).

The DPoE System **SHOULD** be configurable to set thresholds or threshold limits on performance management statistics to create local log, SNMP trap, and syslog events for all statistics.

The DPoE System **MUST** be configurable to set the size of the local log file in kilobytes, megabytes, or gigabytes.

6.8 Syslog Configuration¹³

The DPoE System **MUST** support syslog with support for facilities local0 through local7 (facilities 16 through 23). The DPoE System **SHOULD** offer a method (in the configuration file, at the CLI, and/or with XML) to map specific alarm, fault, error, and informational notifications to each facilities (local0 through local7) which is customizable by the operator.

¹⁰ Revised per IPNEv1.0-N-13.0096-1 on 7/16/13 by JB.

¹¹ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

¹² Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

¹³ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

The DPoE System MUST support logging to at least two syslog servers. The DPoE System SHOULD be configurable to filter the syslog events for each syslog server by at least syslog facility, but MAY also offer the capability to configure by additional criteria.

6.9 Network Element Addressing¹⁴

6.9.1 Loopback IP Address

DPoE System MUST support the configuration and operation of at least one (1) loopback interface. The DPoE System MUST support the configuration and operation of at least one (1) IPv4 host address per loopback interface. The DPoE System SHOULD support the configuration and operation of at least four (4) loopback interfaces. Loopback IP addresses are configured as host addresses and have an all 1's mask as shown in the example below.

Example loopback address configuration:

```
! Loopback for SNMP
interface loopback0
description SNMP address
ip address 10.1.1.1 255.255.255.255
!
! Loopback for Routing
interface loopback1
description D interface forwarding
ip address 1.1.1.1 255.255.255.255
```

6.9.2 I-BEB

The DPoE System is required to act as an I-BEB as specified in [DPoE-SP-MULPIv1.0]. The DPoE System MUST provide the capability to configure a single I-BEB address for the DPoE System. The DPoE System MUST provide the capability to configure the I-BEB from the CLI and in the configuration file. The DPoE System MAY provide the capability to configure the I-BEB with XML.

Example format of a CLI or configuration file command:

```
ibeb <hhhh>.<hhhh>.<hhhh>.<hhhh>
```

Where <hhhh>.<hhhh>.<hhhh>.<hhhh> is the assigned MAC address.

Here is an example with a MAC address:

```
ibeb 0000.0010.FF3C.ABCD
```

The I-BEB address on the DPoE System is the B-SA that DPoE ONUs using [802.1ah] will use when encapsulating ingress traffic to a DPoE ONU S interface. The I-BEB address on the DPoE System is the B-DA of ingress from at the MN interface that are coming from other DPoE ONUs (through DPoE Systems) that have used [802.1ah] encapsulation and configured the B-DA via the DHCP relay process described in [DPoE-SP-MULPIv1.0].

DPoE Systems use a single I-BEB address whether there is one or more than one MN interface. If an operator uses more than one MN interface the same I component Backbone Edge Bridge (I-BEB) could be reachable across more than one interface.

6.9.3 IPv4 Addressing

The DPoE System MUST support IPv4 network and netmask entry at the CLI and in configurations using either of the following two formats shown by example:

Universal Address	1.1.1.0 255.255.255.0
VLSM Short-Form	1.1.1.0/24

¹⁴ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

6.9.4 IPv6 Addressing

This section intentionally left blank.

6.10 Management Addresses¹⁵

The DPoE System SHOULD provide the capability to designate the following IP service proxies, ALGs, and IP signaling and forwarding to each loopback with the CLI, in the configuration file, and via XML (if XML is supported):

- IP forwarding (IP routing)
- SSH2
- FTP/SFTP
- TFTP
- SCP (RCP + SSH2)
- HTTP
- NTP
- TELNET
- DNS (CLIENT)
- SNMPv2/SNMPv3

For example, an operator may choose to allow SSH2 access only to a particular (loopback) IP address on the DPoE System to enhance IPNE security. In another example, an operator may choose to allow FTP on a particular (loopback) IP address in order to limit access to file transfers.

The DPoE System MUST support IPv4 Type of Service (TOS) marking of all IP traffic on the D interface by configuration based on these parameters:

- Source IP address
- Including Management (Loopback) IP Address
- D interface IP addresses
- Source IP Port
 - IP port for the corresponding IP service, proxy, ALG, or daemon

The DPoE System MUST support IPv4 Diff-Serv Code Point (DSCP) (IETF RFC 2474) marking of all IP traffic on the D interface by configuration based on these parameters:

- Source IP address
 - Including Management (Loopback) IP Address
- D interface IP addresses
- Source IP Port
- IP port for the corresponding IP service, proxy, ALG, or daemon

The DPoE System MUST support Access Control Lists (ACLs) to limit or block access to management based on:

- Source IP address
- Source IP Port

¹⁵ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

- Destination IP Address (Management Loopback IP Address if used)
- Destination IP Port

6.11 Documentation Requirements¹⁶

The DPoE System documentation is expected to describe at least the following:

- Physical Dimensions
 - Length, width, depth, and weight of each chassis or shelf
 - Length, width, depth, and weight of all sub-systems, cards, modules, etc.

The noted physical dimensions are expected to indicate clearance required for connectors including network interfaces, power, and safety (grounding) connectors.

- The noted physical dimensions are expected to clearly indicate whether the dimensions for weight, size, and clearance include pluggable optical modules or not in the product documentation.
- The noted physical dimensions are expected to be documented in both text and 2D (two-dimensional) drawings.
- The noted physical dimensions are expected to include an estimated gross weight calculation for a fully-loaded system including the heaviest possible (including optional) line cards and modules and clearly state the assumptions of such a system configuration used to provide such an estimate.
 - Redundant power configuration
 - Power supply load sharing
 - Power supply source voltage, frequency, and current draw for AC and DC. Power factor (for AC supplies).
 - Module or card insertion, removal, and hot-swap procedures
 - Failover process for redundant modules or cards
 - Release notes (bug lists, resolved, and un-resolved)
 - User reference
 - Installation (Software/Image)
 - Cabling
 - Rack mount
 - Interface reference
 - Troubleshooting
 - Technical support contact information
 - Software upgrade (Method of Operation)
 - Environmental requirements for safe and warranted operation include at least:
 - Operating temperature range
 - Operating humidity range
 - Operating altitude
 - Air quality requirements (if applicable)
 - Storage temperature range
 - Storage humidity range

¹⁶ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

- Regulatory compliance as required but at least including:
 - FCC Class and other markings for lasers
 - FCC markings for RF emissions if applicable
 - Underwriters Laboratory Listing (ULL)

The DPoE System documentation must be available online (but may require secure access). The DPoE System documentation must be available for download via FTP or SFTP (but may require secure access). The DPoE System documentation is expected to be available in Portable Document Format (PDF). The DPoE System documentation is expected to be available in a packaged document format that can be viewed online, on a computer, or printed.

6.12 IP Services¹⁷

The DPoE System MUST support the following IP service daemons, helpers, proxies, or ALGs:

- SSH2
- FTP/SFTP
- SCP (RCP + SSH2)
- TFTP
- HTTP
- NTP/SNTP
- TELNET
- DNS Proxy (Server)
- SNMPv2/SNMPv3
- BOOTP Relay
- DHCP Relay [RFC 2131]

These are so called “small servers” and are distinct from the client requirements in section 4.1.5. Each of these provides a service where the DPoE System acts like a server (or host) providing that service to other clients. Those clients may be other hosts, other DPoE Systems, CMTS, routers, switches, or any other host or network element.

The DPoE System MAY support the following IP service daemons, helpers, or ALGs:

- PCMM
- DSG Proxy
- Basic Mode
- Advanced Mode

The DPoE System MUST support an NTP daemon which includes the peer function with at least two NTP servers. The DPoE System MUST support an NTP daemon which includes the gain time function from at least 2 NTP servers. The DPoE System MUST support UTC Time Zone setting for NTP and for DPoE System display, logs, and file system time and date stamping.

The DPoE System MUST support BOOTP and DHCP Relays (helpers or proxies) that filter all other broadcast other than the broadcast discovery packets.

The DPoE System MUST support at least four (4) helper IP addresses for each DHCP, BOOTP, DNS, and other helpers.

¹⁷ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

The DPoE System MUST operate as a DNS proxy, forwarding all DNS queries to DNS servers configured. The DPoE System MUST be configurable to support at least eight (8) DNS servers that may be different from the DNS servers configured for the DNS client (in section 4.1.5) or may be the same.

6.12.1 Other Daemons

The DPoE System MUST support the capability to enable and disable each and every IP service or protocol daemon (as listed above) at the CLI or in the system configuration file.

6.12.2 DHCP Relay Configuration¹⁸

The DPoE System MUST implement a DHCP relay (helper) to implement DHCP as specified in [DPoE-SP-MULPIv1.0].

The DPoE System MUST use the I-BEB configured from section 4.6.1 to populate the DHCP relay-agent for the system capabilities option specified in [eDOCSIS], for the "DHCPv4 PBB service option" defined in [CANN-DHCP-Reg], section 4.2.1.1.3.

6.12.3 Physical Product Requirements

The following requirements are for the physical aspects of the DPoE System.

6.12.4 General Requirements

The DPoE System MUST have hot-swappable line cards for all line cards used within a single chassis.

Centralized components or sub-systems within the DPoE System (such as power supplies, fabrics, switches, and processor cards) SHOULD be redundant and field replaceable.

Redundant options SHOULD be implemented to distribute, move, or fail-over all services and functions in one (1) second or less. Any option that takes longer than one (1) second SHOULD not be identified as redundant.

DPoE System functions that are redundant SHOULD offer a method to manually force a fail-over or otherwise switch service for any redundant capability.

The DPoE System SHOULD be Network Equipment Building Standard (NEBS) Level 3 Compliant.

6.12.5 Power Requirements

The DPoE System SHOULD have redundant power supplies.

The DPoE System SHOULD draw power (load share) across all power supplies rather than operating with a primary and backup or switching implementation. Load sharing is helpful to distribute and manage overall power system reliability in facilities.

6.12.6 Rack Mount Requirements

The DPoE System MUST be rack mountable in an EIA/ECA-310 rack or cabinet.

6.12.7 Cabling

The DPoE System MAY have fiber and twisted-pair Ethernet cable management integrated. The DPoE System MUST NOT require external lashing for interfaces or power connectors.

The DPoE System SHOULD support SC/UPC and LC/UPC connectors for any integrated (not modular) interfaces for MN or D.

¹⁸ Revised per IPNEv1.0-N-13.0064-1 on 2/14/13 by JB.

6.12.8 Grounding

The DPoE System **MUST** have a terminal connector for electrical safety grounding. The DPoE System **MUST** have a wire terminal for electrical (safety) ground bonding.

6.12.9 Environmental Requirements

The DPoE System **MUST** be capable of operating in the temperature range of 0 to 40 degrees Celsius continuously. The DPoE System **SHOULD** be capable of operating in temperatures up to 50 degrees Celsius for up to 24 hours.

The DPoE System **SHOULD** be capable of operating from 5% to 95% humidity.

The DPoE System **MUST** be capable of operating at altitudes from -200 feet (below sea level) to 10,000 feet (above sea level).

6.13 Message of the Day

The DPoE System **MUST** provide a method to configure a Message Of The Day (MOTD) in the configuration file. The DPoE System **MUST** display the MOTD each and every time a secure connection (login) is authenticated to the CLI, regardless of the protocol used for the connection.

6.14 Broadband Intercept (public IP only)

The DPoE System **SHOULD** support broadband intercept using one or more of the following methods:

- [IPFIX]
- Port Mirroring
- ACL Based IP Port Mirroring
- [CBI2.0]

6.15 Diagnostics

Diagnostic functions assist the operator in the operations, administration, and maintenance of the DPoE System. Diagnostic functions are used both interactively and scripted.

6.15.1 System Diagnostics

The DPoE System **MUST** provide a CLI command that dumps all necessary system information (such as configuration, logs, settings, states, etc. to the CLI for debugging, troubleshooting, and reporting).

6.15.2 IP Diagnostics

The DPoE System **MUST** track and support the following statistics per direction for the D and TU interfaces:

- Bits Per Second (BPS) (per interface)
- Packets Per Second (PPS)
- IP Subnets in Use (count)
- ACL Filters in use (count and list of ACL numbers)

The DPoE System **MUST** provide a method to display and reset these statistics from a CLI. The DPoE System **MAY** provide a method to obtain and reset these statistics via an XML (API).

6.15.3 Ethernet Diagnostics

The DPoE System SHOULD support [802.1ag] Connectivity Fault Management (CFM) diagnostics for the D and MN interfaces. The DPoE System MUST support [802.3ah] Link diagnostics on DPoE ONUs by providing a method to operate DPoE ONU S interface diagnostics as specified in [DPoE-SP-OAMv1.0] sections 9.7.8 and 9.7.9.

6.16 Certificate Entry

This section intentionally left blank.

7 EPON SPECIFIC IP NE REQUIREMENTS

In addition to the common requirements, there are some additional DPoE specific requirements for the DPoE System element management, included in the following subsections.

7.1 EPON Configuration

The DPoE System SHOULD provide a CLI command for any DPoE System capabilities to enable and disable TU interfaces or control other EPON settings that the DPoE System may offer.

7.2 EPON Interface Requirements

The DPoE System SHOULD provide a CLI command to enable and disable DPoE ONU Remote Loopback as specified in [DPoE-SP-OSSiv1.0] and [802.3], Clause 57.

7.3 10G-EPON and 1G-EPON Compatibility Settings

The DPoE System MUST provide CLI commands to indicate whether a TU interface is operating as 10G-EPON, 10/1G-EPON, or 1G-EPON. The DPoE System MUST provide CLI commands to show which DPoE ONUs on a TU interface are operating 10G-EPON, 10/1G-EPON, or 1G-EPON.

7.4 Show Cable Modem¹⁹

The DPoE System MUST provide a CLI 'show' command to show the registration status, authentication status, operating interfaces, and the data rate (10G-EPON, 10/1G-EPON, or 1G-EPON) for a DPoE ONU based on a provided DPoE ONU MAC address. The DPoE System MUST support a 'show' command that shows interfaces configured on each DPoE ONU. The DPoE System MUST support a 'show' command that shows received optical power for each DPoE ONU. The DPoE System MUST support a 'show' command that shows the CPE or eSAFE address for each active CMCI and LCI on each DPoE ONU. The DPoE System MUST support a 'show' command that shows the CE or DEMARC MAC address for each active MU and MI on each DPoE ONU. The DPoE System MUST support a 'show' command that shows the S-VLAN ID and C-VLAN ID for each active S1 interface on each DPoE ONU.

Example Show Cable Modem:

```
CLI# show cable modem
Interface SID      State    Rec Power  Interface  CPE or eSAFE address MAC address
CE or DEMARC MAC
tu0             10      <#>      0.25      online CMCI 10.1.1.25      0000.0000.0001
tu0             11      <#>      0.25      online LCI  10.30.2.1      0000.0000.0001
tu0             12      <#>      0.28      online MI   0000.FFFF.0001 0000.0000.0002
tu0             13      <#>      0.30      online MU   0000.FFFF.0002 0000.0000.0003
```

In this example, <#> is a coded number to indicate an EPON or DPoE registration state.

Example Show Cable Modem <MAC>:

```
CLI# show cable modem 0000.0000.0001
Interface SID      State    Rec Power  Interface  CPE or eSAFE address MAC address
CE MAC
tu0             10      <#>      0.25      online CMCI 10.1.1.25      0000.0000.0001
tu0             11      <#>      0.25      online LCI  10.30.2.1      0000.0000.0001
```

¹⁹ Revised per IPNEv1.0-N-14.0116-2 on 2/14/14 by JB.

7.5 EPON Diagnostics

The DPoE System SHOULD support basic EPON debug capabilities such as EPON ONU registration logging, optical power receive, and EPON OAM PDU received message logging. Such EPON debugging SHOULD be operator configurable to be enabled and disabled on per TU interface or per ONU MAC address, or for the entire DPoE System.

7.6 Multi-Source Agreement Transceivers

The DPoE System TU interface SHOULD support one of the Small Form Factor Committee Multi-Source Agreement (MSA) standards for pluggable transceivers such as SFP, SFP+, or XFP. Modular transceiver interfaces provide operators with the flexibility to select, install, or change the proper optical transceiver for current needs on the TU interface.

7.7 DPoE ONU Logging

The DPoE System MUST support logging (local log and syslog) for severe error ONU logging as follows:

- Report DPoE ONUs that register, de-register, and re-register more than N times in T time, where N and T are operator configurable.
- Report the last registration state before a registration failure on every failed DPoE ONU registration.
- Report the optical power and signal parameters available for a failed DPoE ONU registration.

8 DPOE PROTOCOL SPECIFIC SUPPORT²⁰

8.1 MULPI Parameters

8.1.1 Bundling

Virtual bundles are a logical construct used in DOCSIS for a set of configurations that are applied to one or more cable interfaces. While widely used in DOCSIS, there is no standard for this practice in DOCSIS.

Bundling is the mechanism by which multiple TU interfaces can be associated to one (or more) IP serving groups. Alternatively, a DPoE System could be configured to have some set of TUs associated with one bundle and some other non-overlapping set of TUs associated with another bundle.

Below is an example of the configuration to instantiate a bundle on a DPoE System:

```
interface bundle 1
  Description TU0-1
!
interface tu0
  bundle 1
!
interface tu1
  bundle 1
!
interface bundle 2
  Description TU2-3
!
interface tu2
  bundle 2
!
interface tu3
  bundle 2
```

A DPoE System MUST support the configuration of all TUs on the DPoE System to the same bundle.

A DPoE System MUST support the configuration of a bundle for each TU.

8.1.2 IP Serving Group (IP-SG)²¹

IP Serving Group (IP-SG) configurations are largely an organizational function that allows an operator to group a set of similar services to a common IP interface on the router within the DPoE System. Such functionality is achieved today in shipping DOCSIS CMTS products using vendor-specific mechanisms. However, detailed requirements for such mechanisms are not part of DOCSIS specifications. This section describes the configuration capabilities required for the IP-SG.

A sample configuration for a serving group configuration is below:

```
interface tu0
  bundle 1
!
interface tu3
  bundle 1
!
interface bundle 1.1
  Description "Example bundle configuration for default IP-HSD"
  default

  s-vlan 1001
  docsis attribute-mask 80000001
  [ip configuration parameters]
!
```

²⁰ Sections revised per IPNEv1.0-N-13.0085-1 on 6/18/13 by JB.

²¹ Revised per IPNEv1.0-N-14.0116-2 on 2/14/14 by JB.

```

interface bundle 1.2
  Description "Example bundle configuration for default MTA"
  s-vlan 1002
  docsis attribute-mask 80000002
  [ip configuration parameters]
!
interface bundle 1.3
  Description "Example bundle configuration for DEMARC Auto Config (DAC)"
  s-vlan 1003
  bundle-type dac
  [ip configuration parameters]

```

The DPoE System MUST provide CLI configuration command to configure a serving group as shown above.

Also note in the example above the definition of the "docsis attribute-mask" object. In [MULPIv3.0], this object is the SF Required Attribute Mask (TLV24/25.31.) This object might be present in the CM configuration file or it could be referenced via a Service Class object in the CM configuration file. The attribute mask in an SF encoding is used to associate an SF with a particular IP-SG.

When an SF does not contain an SF Required Attribute Mask as part of its provisioning, the SF is considered to be part of the IP-SG with the "default" keyword in the configuration, as shown above for "bundle 1.1".

When an S-VID is configured as part of an IP serving group for IP(HSD), the DPoE System OLT MUST add the S-VID, along with the default S-TPID value of 0x88a8, with S-PCP set to 0x0 and S-DEI set to 0x0 to the frame before forwarding the frame to the DPoE System router.

The DPoE System MUST use the configured SF Required Attribute Mask (TLV24/25.31) to associate provisioned IP(HSD) service flows with an serving group.

Finally, in the example above note the definition of the "bundle type" object. This object in the configuration example is the configuration of the serving group to associate dynamically configured DAC service-flows to the DAC serving group.

The DPoE System MUST support a serving group that is configured as the IP interface for all dynamically created DAC SFs. The dynamically created DAC SFs would use the S-VID pool associated with the serving group to dynamically generate the S-VID and C-VID used for purposes of encapsulating Ethernet frames from the DEMARC management entity to the router within the DPoE System. The example above shows the bundle-type DAC object as the configuration object to identify the serving group as the DAC IP interface.

The DPoE System MUST have a type attribute to specify whether the bundle uses the DAC mechanism for steering service flows to a service group or whether the bundle uses the IP(HSD) methods (the SF Required Attribute Mask) for steering service flows to a service group.

8.2 MEF Parameters

8.2.1 Encapsulation and Tagging

The DPoE System MUST provide 'show' commands to show the type of encapsulation in use for each S interface configured and active on DPoE ONUs. The DPoE System MUST provide a 'show' command to show all interfaces operating with [802.1ah] encapsulation in a summary.

This example would show PBB [802.1ah] forwarding active, by port, on TU number 0:

```
show interface tu0 pbb
```

This example would show PBB [802.1ah] forwarding active, by port, all TU interfaces:

```
show interface pbb
```

The DPoE System MUST provide a 'show' command to show all [802.1ad] tagging, including S-VLANs assigned for use by IP-HSD, in a summary.

This example would show PB [802.1ad] forwarding active, by port for all TU interfaces:

```
show interface pb
```

The DPoE System MUST provide a 'show' command to show all MU and MI interfaces operating with [802.1ad] tagging in a summary.

This example would show PB [802.1ad] forwarding active, by port, on TU number 0:

```
show interface tu0 pb
```

This example would show PB [802.1ad] forwarding active, by port, all TU interfaces, excluding IP(HSD):

```
show interface pb
```

8.2.2 TPID Translation

The DPoE System MUST provide a 'show' command to show all TPID translation in use on the system or by interface.

This example would show TPID translation by port on TU number 0:

```
show interface tu0 xtpid
```

This example would show TPID translation by port on all TU interfaces:

```
show interface xtpid
```

8.2.3 I-BEB

The DPoE System MUST provide a 'show' command to show the I-BEB configured for the DPoE System.

This example would show the I-BEB configured for the DPoE System:

```
show ibeb
```

8.3 OSSI Parameters

DPoE Systems MUST provide a method of limiting the rate of DHCP lease renewals by providing a configurable limit of the number of lease renewals permitted on the DPoE System, for each individual helper (relay) for a moving window for which the period (in seconds) is configured.

9 COMBINED IP(HSD) AND MEF NNI FORWARDING REQUIREMENTS

Both the D and MN interfaces on DPoE Systems share Ethernet interface and forwarding requirements identified in this section.

9.1 Ethernet Interface Requirements²²

The DPoE System MUST be capable of forwarding Ethernet frames on the D and MN interfaces using [802.1d], [802.1q], [802.1ad], and [802.1ah].

9.1.1 Link Aggregation (LAG)

The DPoE System MUST support [802.1ax] Link Aggregation on the D and MN or combined D and MN interfaces for all network to network traffic. The DPoE System MUST support LAG for the smaller of either eight (8) ports or the maximum number of D and MN ports on the DPoE System. The latter would, for example, apply to a DPoE System that might have only 7 or less ports.

The DPoE MUST support [802.1ax] LAG for all [802.3z] ports or all [802.3ae] ports. The DPoE System MUST NOT support [802.1ax] across both [802.3z] and [802.3ae] ports.

9.1.2 D and MN Interface Data Rates

DPoE Systems with 1G-EPON only MUST support 1GigE for the D and MN interfaces. DPoE Systems with 10G-EPON (10/1G-EPON or 10/10G-EPON) MUST support 10GigE for the D and MN interfaces. DPoE Systems with 10/1G-EPON or 10G-EPON MAY support 1GigE.

DPoE Systems SHOULD support modular MSA-compliant Ethernet interfaces for the MN and D interfaces.

9.1.3 NNI Link Aggregation

The DPoE System MUST allow the D and MN interfaces to operate over a combined (trunked) Ethernet interface, using [802.1q] VLAN tags to separate the two logical interfaces.

9.1.3.1 NNI Link Aggregation Egress Tagging

If a DPoE System is configured to combine D and MN using [802.1q], that tag MUST be applied as an outer (trunking) tag in addition to existing [802.1q], [802.1ad], or [802.1ah] tags. A DPoE System multiplexing the logical D and MN interfaces into a single Ethernet interface MUST NOT remove or re-write any existing tags upon egress from MN or D.

DPoE ONUs can accept frames that are tagged by the customer. In addition to accepting customer tagged frames, DPoE ONUs can be configured to add up to two additional [802.1ad] tags. With the addition of an optional outer tag (described herein) for NNI link aggregation, egress frames may contain up to four (4) [802.1ad] tags or a combination of up to four (4) [802.1q] and [802.1ad] tags if TPID translation is used for the service.

DPoE ONUs can accept frames that are tagged by the customer. In addition to accepting customer tagged frames, DPoE ONUs can be configured to add [802.1ah] encapsulation (tagging). With the addition of an optional outer tag (described herein) for NNI link aggregation, egress frames may contain a combination of up to three (3) [802.1ad] tags and a [802.1ah] encapsulation or a combination of up to three (3) [802.1q] and [802.1ad] tags and single [802.1ah] encapsulation, if TPID translation is used for the service.

9.1.3.2 NNI Link Aggregation Ingress Tagging

If a DPoE System is configured to combine D and MN using [802.1q] that (trunking) outer tag MUST be removed before passing the frame to the logical D or MN interface.

²² Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

9.2 IP Forwarding Requirements²³

IP forwarding requirements apply to the D interface, TU interface, or S1 interfaces as described below. TU interfaces used for IP(HSD) can also be concurrently used for Metro Ethernet services. When TU interfaces are configured for IP(HSD) service, the IP forwarding requirements only apply to IP(HSD) services and therefore only to S1 interfaces configured as CMCI or LCI interfaces.

9.2.1 IP Interfaces

The DPoE System **MUST** support Variable Length Subnet Masking (VLSM) on all IP interfaces. The DPoE System **MUST** support IP subnet masks of any length on the D interface. (For example, an operator may use this option to configure /31 or 255.255.255.254 subnet mask length of subnet mask for point to point networks in order to conserve IP address space).

9.2.1.1 Multinet

The DPoE System is expected to support the capability to configure and operate multiple IP addresses per physical or logical (sub-interface) interface. The DPoE System **MUST** support at least four (4) IP subnetworks for each SG interface. The DPoE System **MUST** support at least four (4) IP subnetworks for each D interface.

9.2.1.2 TU Forwarding Rates

The DPoE System **MUST** support IP-SG commands to associated service address verification, ACLs, sub-interfaces, and Address Resolution Protocol (ARP) filters with an IP-SG

A DPoE System is expected to be capable of forwarding at least 900Mbps downstream and 900Mbps upstream on a 1G-EPON TU with sixty-four (64) DPoE ONUs registered.

A DPoE System is expected to be capable of forwarding at least 9Gbps downstream and 9Gbps upstream on a 10G-EPON TU with sixty-four (64) DPoE ONUs registered.

9.2.1.2.1 Access Control Lists

The DPoE System **MUST** support ACLs and EACLs on the D interface to limit and control access to any IP address and port combination based on source IP address, source port, destination IP address, and destination port for all IP addresses configured on the DPoE System including loopback addresses (if configured), interface addresses, vCM addresses, and embedded Cable Modem (eCM) addresses (if present) and CPE addresses assigned for any active CMCI interfaces.

The DPoE System **SHOULD** be configurable to apply such ACLs or EACLs to all or only to specific D interfaces. This will allow operators to use different ACLs on different interfaces if desired.

The DPoE System **MAY** support EACL for traffic on the D interface based on TCP State.

The DPoE System **MUST** support Layer 2 ACLs on the D and MN interfaces. The DPoE System **MUST** support the following parameters for Layer 2 ACLs:

- MAC
- Source Address
- Destination Address
- MAC Address Ranges
 - Source Address
 - Destination Address
- [802.1ad]
- S-VLAN ID
- C-VLAN

²³ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 and per IPNEv1.0-N-13.0085-1 on 6/18/13 by JB.

- [802.1q] VLAN ID
- [802.1] TPID
- [802.1ah] I-SID

The DPoE System MAY support the following parameters for Layer 2 ACLs:

- [802.1ah] B-Tag

The DPoE System MUST support logging ACL matches. The DPoE System MUST support enabling and disabling of logging of ACL matches.

9.2.2 Multi-Protocol

This version of the DPoE specifications supports only IPv4 forwarding and does not require IP routing protocol support for Layer 2 (Ethernet), IPv6, IP-VPN, or other address family route distribution.

9.2.3 Label Forwarding

DPoE Systems MAY support Multiprotocol Label Switching (MPLS) using Label Distribution Protocol (LDP) for the D interface.

9.2.4 SF QoS Assignment²⁴

The DOCSIS Service Class is referenced within the CM configuration file and points to a configured Service Class on the DPoE System,

The DOCSIS Service Class is defined in [MULPIv3.0].

The DPoE System MUST support the configuration of a DOCSIS Service Class, which includes (at a minimum) the following configurable elements::

- Service Class Identifier
- Direction
- Service Class Name
- ToS Overwrite
- Priority
 - Service Flow Scheduling Type to include RTPS and Best Effort
 - Nominal Polling Interval
 - Maximum Sustained Traffic Rate
 - Maximum Traffic Burst

The DPoE System SHOULD support the configuration of a DOCSIS Service Class, which includes the following configuration element:

- SF Required Attribute Mask (TLV24/25.31)

The DPoE System MAY include more configuration elements within the service class beyond those enumerated here.

²⁴ Section added per IPNEv1.0-N-13.0085-1 on 6/18/13 by JB.

9.3 IP Routing²⁵

9.3.1 Route Distribution

DPoE Systems MUST support IP route re-distribution from every active IP routing protocol to every other IP routing protocol. DPoE Systems SHOULD support the re-distribution of at least 8,000 routes from any IP routing protocol into every other IP routing protocol.

9.3.2 Bi-Directional Forwarding Detection

DPoE Systems MUST support Bi-Directional Forwarding Detection (BFD) as specified in [RFC 5880], [RFC 5881], and [RFC 5882] on the D interface. DPoE Systems MUST provide configurable timers for BFD. DPoE Systems SHOULD support timers as low as 1 second. BFD is described in [RFC 5880], [RFC 5881], [RFC 5882], and [RFC 5883].

9.3.3 Equal Cost Multi-Path

DPoE Systems MUST support Equal Cost Multi-Path (ECMP) for IP forwarding based on all IP routing protocols and static routes (including default route and default network).

DPoE Systems SHOULD be able to forward across at least 16 MAX-PATHS for ECMP.

9.3.4 Policy Routing

DPoE Systems MUST support source policy based routing. That is routing decisions based on the source IP address rather than destination IP address based lookup only.

9.3.5 Static Routes

DPoE Systems MUST support static IP routes configured by the configuration file or at the CLI. DPoE Systems MUST provide the capability to remove static routes from the active forwarding routes (but keep the configuration file the same) when BFD detects a next hop failure.

9.3.6 Default Route

The DPoE System MUST support the configuration and forwarding of a static route to which all traffic not otherwise reachable by other routing protocols or static routes, should be forwarded by default. DPoE Systems MUST support at least four (4) default routes. DPoE Systems MUST support BFD for default routes just as for static routes. DPoE Systems MUST provide the capability to remove default routes from the active forwarding routes (but keep the configuration file the same) when BFD detects a next hop failure.

9.3.7 Interior Gateway Protocols (IGPs)

DPoE Systems MUST support both IS-IS and OSPFv2 ([RFC 2328] and [RFC 3623]) for IGP routing. DPoE Systems MUST support re-distribution of routes between IGPs and between IGPs and other routing protocols if implemented. The DPoE System MUST support route maps for configuration of IP route distribution between routing protocols.

DPoE Systems MUST support the capability to run both IS-IS and OSPFv2 simultaneously.

DPoE Systems MUST provide the capability to remove OSPF or IS-IS adjacencies from the link state database (but keep the adjacency configured) when BFD detects an adjacency failure. The DPoE System MUST keep running BFD and upon recovery from the link failure, should re-establish the adjacency and admit the route to the link state database.

²⁵ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

9.3.7.1 OSPF

DPoE Systems MUST support OSPF “not so stubby” areas. DPoE Systems MUST support the ability to set tag values per IP subnet in type 7 Link State Advertisements (LSAs). DPoE Systems MUST support point to point links without a default router (DR). DPoE Systems MUST label routes redistributed into OSPF as type 5/7 LSAs. DPoE Systems MUST support Graceful OSPF Restart [RFC 3623].

9.3.7.2 IS-IS

DPoE Systems MUST support multiple-topology IS-IS (M-ISIS) as specified in [RFC 5120]. DPoE Systems MUST support MT extensions for LSP in order to support multiple-topology as specified in [RFC 5311].

9.3.8 Autonomous System Routing

The DPoE System MUST support BGP [RFC 4271] for the distribution of route throughout an Autonomous System. The DPoE System MUST support iBGP. The DPoE System MUST support route reflector client as specified in [RFC 4456]. The DPoE System MUST support iBGP peering with at least two neighbors total. DPoE Systems MUST support Graceful Restart for all BGP (iBGP) peers. DPoE Systems MUST support BGP confederations [RFC 5065]. DPoE Systems MUST support the MD5 signature option [RFC 2385].

The DPoE System MUST support community tagging for announced and received IP routes with iBGP [RFC 1997]. The DPoE System MUST support the concurrent tagging of at least 16 communities for each announced or received route for IP routes for iBGP. DPoE Systems MUST support route policy controls including prefix filtering, filter lists, and route maps DPoE Systems MUST support basic comparative logic for policy controls including at least:

- Less Than (lt)
- Less Than or Equal To (lte)
- Greater Than (gt)
- Greater Than or Equal To (gte)
- Equal To (et)

DPoE Systems SHOULD use VLSM or CIDR subnet length notation in the form of:

/<masklen>

Where <masklen> is the length of the subnetwork mask.

DPoE Systems MUST support the following policy control settings:

- IP TOS
- DSCP
- Local Preference
- Metric
- Metric Type
- Weight
- Next Hop (NH)
- Origin
- Tag
- Traffic Index

DPoE Systems MUST support blocking, filtering, suppression, aggregation, and summarization of IP routes based on BGP policy matches.

9.3.9 BGP Routing

Although multi-protocol forwarding for non-IPv4 traffic is not required in this version of the DPoE specifications, the DPoE System MUST support BGP [RFC 4271] routing for IP traffic engineering and routing.

9.3.10 MPLS

This version of the specification does not require MPLS.

9.4 IP Routing Debug

The DPoE System MUST provide IP routing debug tools including:

- Local log and syslog for IP routing state changes for adjacencies
- Local log and syslog for configuration changes that affect IP routing protocols

The DPoE System SHOULD provide IP-routing debug tools including local log and syslog for IP routing “events”, where an “event” is defined as a state change in an IP routing protocol.

The DPoE System SHOULD provide a configurable IP routing debug tool for “trace” capability for each IP routing protocol (independently). The IP routing debug tool SHOULD show received messages, state changes, parameters, and statistics in near real time to the console, to the local log, and to syslog (if logging is enabled for trace in the configuration for IP routing debug).

9.5 Host Routing

The DPoE System typically treats IP(HSD) clients on the DPoE ONU CMCI interface as hosts on the DPoE System IP router.

The DPoE System MUST be configurable to disable Address Resolution Protocol (ARP) individually for each DPoE ONU CMCI port. The DPoE System MUST be capable of disabling ARP individually for each DPoE ONU CMCI port by DPoE ONU (EPON) MAC address and a port index. If a DPoE ONU has only one CMCI port or has only one CMCI port configured, the DPoE System MUST be configurable to disable ARP for that CMCI port based only on the DPoE ONU CMCI port.

The DPoE System SHOULD be configurable to disable ARP individually (filter ARP requests) for each IP address when there are multiple IP addresses assigned on a single DPoE ONU CMCI port.

9.6 CMCI Routing²⁶

DPoE Systems MUST support Routing Information Protocol (RIPv2 [RFC 2453] and [RFC 4822]) for dynamic IP address learning from a CPE running RIP. The DPoE System MUST act as an IP router (peer) to the CPE running RIP.

A DPoE System that supports RIP MUST provide a method of verifying the source IP addresses and source CMCI port from which each IP packet is sourced in order to secure the IP forwarding path when IP routing is operating over CMCI interface.

DPoE Systems MUST support static IP routing for the CMCI interface.

DPoE Systems MUST support source policy based routing for IP forwarding from CMCI. That is routing decisions based on the CPE source IP address rather than destination IP address based lookup only.

²⁶ Revised per IPNEv1.0-N-12.0044-2 on 8/14/12 by JB.

9.7 IP Traffic Engineering

The DPoE System MUST support IPv4 Terms of Service (TOS) marking of all IP traffic on the D interface by configuration based on the common parameters described below. The DPoE System MUST support IPv4 Diff-Serv Code Point (DSCP) [RFC 2474] marking of all IP traffic on the D interface by configuration based on the common parameters described below.

- Management Traffic
- Loopback IP address
- TU interface
- IP ACLs

Appendix I CMTS Example Configuration File A

Following is the majority of a complete configuration file for a typical DOCSIS 2.0 CMTS used in production today. When <angle brackets> are used, the actual text in the configuration file varies among operators or was removed to make the configuration generic to all operators. Other comments indicate if other sections were purposefully omitted to keep the example brief and readable.

Appendix II CMTS Example Configuration B

II.1 CMTS Example Configuration B File with Explanations

Following is the majority of a complete configuration file for a typical DOCSIS 1.1 CMTS used in production today with explanatory text added following each bang “!” symbol. When <angle brackets> are used, the actual text in the configuration file varies among operators or was removed to make the configuration generic to all operators. Other comments indicate if other sections were purposefully omitted to keep the example brief and readable.

```
!!!!
!
! DOCSIS 1.1 Example Configuration File B
!
!!!!
no service single-slot-reload-enable
service nagle
service sequence-numbers
no service pad
service timestamps debug datetime msec localtime show-timezone
service timestamps log datetime msec localtime show-timezone
service password-encryption
no ip bootp server
no ip gratuitous-arps
no service tcp-small-servers      ! default, does not show in
! configuration
no service udp-small-servers      ! default, does not show in
! configuration
no scheduler heapcheck process    ! default, does not show in
! configuration. If enabled, will
! show towards the end of the
! configuration
scheduler allocate 4000 400      ! Improves processing of interrupts
! when large numbers of modems are
! online; default 4000 400
no ip forward-protocol udp ! improve modem registration times
hostname <local Hostname> ! local hostname
!

!
! SSH Enable
crypto key zeroize rsa
crypto key generate rsa
line vty 0 15
transport input all
transport output all
!
! Global Cable Commands
! The following command causes the CMTS to enforce a MAX-CPE value of 10 for each
cable modem. If a value
! greater than 10 is specified in the modem configuration file, the higher value will
be enforced. Note: The
! default value of 1 for max-cpe will not show in the running configuration.
! cable modem max-cpe 10
no cable qos permission create      ! default IOS entries
no cable qos permission update
```

```

cable qos permission modems
ip dhcp relay information option ! Insert relay information in DHCP
! This following command modifies the non-packetcable DOCSIS 1.1 service flow timeout
behavior. It allows a
! user-definable Active QoS Timeout to be set from the CMTS to prevent stale service
flows. See Cisco
! documentation for detailed information on this configurable timer.
cable service flow activity-timeout 300
!
! Buffer Configuration
! The following configurations more optimally tune the buffers than that of default
such that buffer failures
! are minimized:
buffers small permanent 310
buffers small max-free 515
buffers small min-free 65
buffers middle permanent 258
buffers middle max-free 360
buffers middle min-free 80
buffers big permanent 528
buffers big max-free 828
buffers big min-free 180
buffers verybig permanent 42
buffers verybig max-free 43
buffers verybig min-free 6
!
! Flap-List Configuration
! The following configuration tunes the operation of the flap-list command.
cable flap-list insertion-time 180
cable flap-list power-adjust threshold 3
! Power adjust using different |thresholds requires a locally |created CR and should
be |temporary until the
! plant has |been stabilized.
cable flap-list aging 1440
cable flap-list size 8191
!
! Network Time
! omitted from this example
!
! Global Routing Commands
ip subnet-zero
no ip source-route
ip cef
ip classless
!
! Name Resolution
no ip finger
ip domain-lookup ! Default, does not show in
! configuration
ip domain-name <local domain name>
ip name-server <primary server> | Only one name server
!
! Multicast Routing
ip multicast-routing
ip multicast route-limit 250
no cable ip-multicast-echo ! default, does not show in
! configuration
!
! Route Authentication Key Strings
key chain ubr-rip ! Key string for Static IP Solution
key 1
key-string <key string 1>
key 2

```

```

    key-string <key string 2>
! Note: Multiple key strings are supported. Key ID must match. Key-string should be 16
alphanumeric characters ! or less.
!
! Generic Interface Configuration
interface <interface name and index>
    description <description> ! include destination and circuit ID info if applicable
    no ip directed-broadcast ! Does not show in running-config
    no ip proxy-arp
    no ip redirects
    keepalive
    no ip mroute-cache
!
! Loopback Interface Configuration
! The loopback interface is a virtual interface that is independent of all hardware
interfaces. Since this
! interface will always be "up", it is used by SNMP and routing protocols to gather
information. The netmask
! should be /32. The Description text should include serial number, model of router,
local contact and contact
! phone number, and the location of the equipment. It is not necessary to include the
generic interface
! configuration on a loopback as all commands are not fully supported nor needed.
!
interface loopback0
description <s/n, Contact, phone #, location>
ip address <ip address> <netmask>
!
! Fast Ethernet Interface Configuration
! The following commands apply only to the Fast Ethernet port on the uBR's I/O
controller.
interface fastethernet 0/0
duplex full ! Ensure hub or switch is set to full duplex
ip ospf cost 20 ! Needed to ensure fastethernet is
! not used for transit traffic |(except when used for legacy | equipment or uBR
to uBR |
! connections)
!
! NPE-G1 Gigabit Ethernet Interfaces
! The following commands apply only to the 3 onboard Gigabit Ethernet interfaces on
the NPE-G1 processor. If
! you want to use these interfaces to replace the Fast Ethernet interfaces on the
existing I/O controller, you
! will have to configure the new interfaces before they can be used to access the
network. If you are also
! removing the existing I/O controller, you will need to remove the configuration for
its Fast Ethernet
! interfaces. Note, The RJ-45 ports and GBIC ports are both reported in software as
GigabitEthernet 0/1,
! GigabitEthernet 0/2, and GigabitEthernet 0/3. Only one of the pair of interface
ports can be used at a time.
! For example, you can use either the GBIC 0/2 port or the RJ-45 0/2 port, but not
both. All generic interface
! configurations still apply but are not shown below (e.g. ospf cost, priority).
!
interface GigabitEthernet<slot/port> ! Configure for FastEthernet
    ! using rj45
duplex full ! Force full duplex operation
speed 100 ! Force 100 Mbps operation
media-type rj45 ! Set media to use rj45
no negotiation auto
!
interface GigabitEthernet<slot/port> ! Configure for Gigabit Ethernet

```

```

! using gbic
duplex full ! Force full duplex operation
speed 1000 ! Force 1000 Mbps operation
media-type gbic ! Set media to use gbic
no negotiation auto
!
! Dedicated Access
! The dedicated access solution for commercial services customers using the 3550 can
! be connected directly as a ! Fast Ethernet connection to one of the GigabitEthernet
! ports available on the NPE-G1. This connection MUST
! be configured as FastEthernet only provided the following conditions are met:
! 1. Hubsite must not have an existing aggregation router connected to the
! distribution network, i.e.
! 10720, 75XX, or 12XXX.
! 2. CMTS must have an NPE-G1 processor running at a n monthly max CPU five minute
! average of less than 50%
! (as reported by MRTG).
! 3. Uplink to CMTS is limited to a single full-duplex 100Mb/sec FastEthernet
! segment. GE is not permitted.
! Standard OSPF configurations still apply.
!
! Generic Cable Interface Configuration
interface Cable <slot>/<port> ! Commands should be repeated for all cable
! interfaces.
!
no ip unreachable | To prevent unnecessary ICMP replies
no cable ip-multicast-echo | Disable multicast echoing( on all master bundles.
!
cable shared-secret <z> <authen-key string>
! Used to reduce theft of service by non-subscribers. It works by using a single
! shared-secret key configured
! in both the CMTS and the DOCSIS config file that is sent down to cable modems prior
! to them coming online
!
cable map-advance dynamic !re-enable dynamic map advance on
!all line cards. This command is the
!default and does not show in the
! running configuration.
!
cable arp filter request-send 4 2
cable arp filter reply-accept 4 2 !ARP filtering limits ARP traffic per SID. This must
! be configured on all downstream interfaces including both master and slave interfaces
! Cable Interface Downstream Configuration (without Bundling)
interface cable <ds interface>/0 ! Commands should be repeated for all interfaces.
! Each cable interface should be configured with at least one primary and one
! secondary address. The primary
! address must always be used for cable modems. The secondary addresses are used for
! customer premise
! equipment. Please contact <> if your configuration does not match this standard.
! Under circumstances when the primary cable modem scope becomes insufficient to
! support all devices and needs
! to be expanded, a secondary CM scope may be configured to allow for additional
! growth. The <> operations
! manual should be consulted for configuration guidelines.
! All ingress interfaces should be configured to verify the reverse path of incoming
! packets. This is done to
! prevent "spoofing" attacks. Ingress interfaces would be those interfaces, which
! connect the Road Runner
! network to either customers or other public networks. This is different from the
! "cable source-verify"
! feature, however the two perform a similar function.
!
! Multinet

```

```

ip address <address> <mask> secondary      | CM (secondary added for growth)
ip address <address> <mask> secondary      | CPE (secondary)
ip address <address> <mask>                | Cable Modem (primary)
!
cable insertion-interval automatic
cable dhcp-giaddr primary ! If this is not the case, please
!
ip verify unicast reverse-path allow-self-ping
cable helper-address <primary cpe dhcp server> host
cable helper-address <secondary cpe dhcp server> host
cable helper-address <primary cm dhcp server> cable-modem
cable helper-address <secondary cm dhcp server> cable-modem
!

ip rip authentication mode md5
ip rip authentication key-chain <key string name>
default cable downstream rate-limit      ! Does not show in configuration
cable downstream annex B
!
! The downstream modulation may be set to either 64QAM or 256QAM depending on the
capabilities of the local RF
! plant (256qam is the preferred setting). Please contact <> before changing from
64QAM to 256QAM due to the
! increased carrier to noise ratio requirements.
! cable downstream modulation <64qam or 256qam>      | 256qam preferred
cable downstream interleave-depth 32
cable downstream frequency <ds frequency>          | Note this is a comment only and
cable privacy kek life-time 604800                | Default, does not show in
cable privacy kek grace-time 600 | Default, does not show in
cable privacy tek life-time 43200 | Default, does not show in
cable privacy tek grace-time 600 | Default, does not show in
!
no cable downstream rf-power
! Cable Interface Downstream Configuration (with Bundling)
! Cable Interface Bundling allows multiple interfaces to share a single IP network
number. A given CMTS may
! have multiple bundles depending on the number of hosts per interface. For example,
a newly deployed CMTS
! could have all four interfaces in a single bundle. If after a period of time, the
user population could be
! segmented into two groups of 500 to 700 users, each using two interfaces, it would
be more efficient to split
! the configuration into two bundles. The commands used with Interface Bundling are
identical to those used
! without Interface Bundling with some minor exceptions.
! The bundled interfaces must be assigned to a Virtual Bundle by the commands:
interface cable <ds interface>/0
cable bundle <bundle id>
! The remaining configuration of the bundled interfaces would be identical to the
configuration used on the
! unbundled interface without the layer-3 configurations such as:
! 1. IP addresses are not required
! 2. Cable Helper addresses are not required
! 3. RIPv2 authentication is not required
! 4. Source-Verify and Lease-Timer functions
! 5. PIM
! 6. Access-lists (ACLs)
! 7. Sub-interfaces
! 8. Cable ARP filters
! The upstream configuration does not change in any way if bundling is enabled.
!
! Virtual Bundle Interface

```

! In IOS 12.3(17b)BC4, Virtual Bundle Interface supports bundled cable interfaces to allow multiple cable ! interfaces to share a single IP network number. Virtual interface bundling supports and governs the following ! Layer 3 settings for the bundle member interfaces:

- ! 1. IP address scopes
 - ! 2. Cable Helper addresses
 - ! 3. RIPv2 authentication
 - ! 4. Source-Verify and Lease-Timer functions
 - ! 5. PIM
 - ! 6. Access-lists (ACLs)
 - ! 7. Sub-interfaces
 - ! 8. Cable ARP filters
- ! Ex:

```
interface Bundle1
    ip address 10.200.200.1 255.255.255.0 secondary
    ip address 10.200.111.1 255.255.255.0 secondary
    ip address 10.200.112.1 255.255.255.0 secondary
    ip address 24.28.219.1 255.255.255.128 secondary
    ip address 10.200.2.1 255.255.255.0
    ip verify unicast reverse-path allow-self-ping
    ip rip send version 2
    ip rip receive version 2
    ip rip authentication mode md5
    ip rip authentication key-chain ubr-rip
    ip pim sparse-mode
    cable arp filter request-send 4 2
    cable arp filter reply-accept 4 2
    no cable ip-multicast-echo
    cable dhcp-giaddr primary
    cable helper-address 10.203.3.6
```

! The bundled cable interfaces must be assigned to a Virtual Bundle by the commands:

```
interface cable <ds interface>/0
cable bundle <bundle id>
```

```
!
interface Cable3/0
cable bundle 1
```

```
!
interface Cable3/1
    cable bundle 1
```

```
!
! Cable Interface Upstream Configuration
cable upstream <us channel> description <Fiber Node(s) connected>

! Crash Dumps
! As a temporary troubleshooting measure (usually at the request of the vendor), it is
approved to place the
! following command into the configuration:
! exception crashinfo file slot0:      | slot0:/disk0: for NPE other then | G1. G1's
use disk2:
!
! Packet Cable Multi-Media (PCMM)
access-list 6 permit host <ip address> | grant SNMP RO access from PCMM server
packetcable authorize vanilla-docsis-mta      | enable PCMM
packetcable multimedia      | enable PCMM
ip access-list extended cops      | specify acl to allow access
    permit ip host <VIP1 address of regional MPE> host <ubr's loopback address>
    permit ip host <VIP2 address of regional MPE> host <ubr's loopback address>
cops listener access-list cops      | apply the acl to the PCMM process

! Modulation Profile(omitted)
! Channel Width (omitted)
! Modulation Profile in interface example (omitted)
!
! Activating DHCP Relay
! The cable relay agent is for use with DOCSIS-based DHCP servers that use option 82
to automatically map the
! Ethernet MAC address of a host (end user PC) with the cable modem to which it is
connected.
!
! With the cable relay agent activated, the Cisco uBR7200 series will insert the cable
modem MAC address into a
! DHCP packet when a packet is received from a cable modem or another host. The Cisco
uBR7200 series will then
! forward the packet to a DHCP server.
! To activate the cable relay agent on each interface, use the following command
global command:
ip dhcp relay information option
!
! Tool Access

```

```
ip rcmd rsh-enable
ip rcmd remote-host cmit xx.xx.xx.xx cmit
! CMIT is the name of the remote |client and xx is the ip address |of the unit the
client is |accessing from.
! There could be |multiple entries for each ip |address and client permitted |access.

II.2 CMTS Example Configuration File B

Following is the majority of a complete configuration file for a typical DOCSIS 1.1 CMTS used in production today. When <angle brackets> are used, the actual text in the configuration file varies among operators or was removed to make the configuration generic to all operators. Other comments indicate if other sections were purposefully omitted to keep the example brief and readable.

Appendix V Acknowledgements

On behalf of our industry, we would like to thank the following individuals for their contributions to the development of this specification.

Contributor	Company Affiliation
John Dickinson, Edwin Mallette	Bright House Networks
Shamim Akhtar, Phillip Chang, Jason Combs, Doug Jones, Saif Rahman, Matt Scully, Rashid Siddiqui, Mehmet Toy, Bin Wen	Comcast
Victor Blake	Independent Consultant
Ron daSilva, Robert Harris, Shan Huang, Mike Kelsen, Tushar Nakhre, Karen Rice	Time Warner Cable

Appendix VI Revision History

VI.1 Engineering Change for DPoE-SP-IPNEv1.0-I02-120607

The following Engineering Change was incorporated into DPoE-SP-IPNEv1.0-I02-120607:

ECN	Date Accepted	Summary	Author
IPNEv1.0-N-12.0029-1	05/12/12	SNMPv3 Requirement Relaxation within DPOE IPNE	Kirk Erichsen

VI.2 Engineering Change for DPoE-SP-IPNEv1.0-I03-120830

The following Engineering Change was incorporated into DPoE-SP-IPNEv1.0-I03-120830:

ECN	Date Accepted	Summary	Author
IPNEv1.0-N-12.0044-2	08/13/12	IPNE-EC	Edwin Mallette

VI.3 Engineering Change for DPoE-SP-IPNEv1.0-I04-121115

The following Engineering Change was incorporated into DPoE-SP-IPNEv1.0-I04-121115:

ECN	Date Accepted	Summary	Author
IPNEv1.0-N-12.0045-1	10/18/12	Clarification to zero suppression feature	Marek Hajduczenia

VI.4 Engineering Change for DPoE-SP-IPNEv1.0-I05-130328

The following Engineering Change was incorporated into DPoE-SP-IPNEv1.0-I05-130328:

ECN	Date Accepted	Summary	Author
IPNEv1.0-N-13.0064-1	02/14/13	Remove references to Annex F in MULPI	Marek Hajduczenia

VI.5 Engineering Changes for DPoE-SP-IPNEv1.0-I06-130808

The following Engineering Changes were incorporated into DPoE-SP-IPNEv1.0-I06-130808:

ECN	Date Accepted	Summary	Author
IPNEv1.0-N-13.0085-1	06/06/13	Align IPNE DPoEv1.0 and v2.0 semantics, reqs and description	Edwin Mallette
IPNEv1.0-N-13.0096-1	07/11/13	Remove hard and soft reboot config file requirement	Curtis Knittle

VI.6 Engineering Change for DPoE-SP-IPNEv1.0-I07-140327

The following Engineering Change was incorporated into DPoE-SP-IPNEv1.0-I07-140327:

ECN	Date Accepted	Summary	Author
IPNEv1.0-N-14.0116-2	02/06/14	IP(HSD) Changes for IPNEv1.0	Curtis Knittle
