Key to Document Status Codes

Work in Progress	An incomplete document, designed to guide discussion and generate feedback that may include several alternative requirements for consideration.
Draft	A document in specification format considered largely complete, but lacking review by Members and vendors. Drafts are susceptible to substantial change during the review process.
Issued	A stable document, which has undergone rigorous member and vendor review and is suitable for product design and development, cross-vendor interoperability, and for certification testing.
Closed	A static document, reviewed, tested, validated, and closed to further engineering change requests to the specification through CableLabs.

1 SCOPE

1.1 Introduction and Purpose

This document specifies how the PacketCable E-UE Provisioning Framework can be used to configure and manage Embedded 2.0 UEs (E-UEs) supporting the PacketCable Residential SIP Telephony (RST) application.

The PacketCable architecture provides a generic Provisioning Framework for E-UEs, but requires PacketCable application efforts such as RST to specify application-specific requirements and data models. This document specifies such requirements and the data model for the PacketCable RST application. It also specifies the requirements and a data model for E-DVAs, a specific E-UE type specified by PacketCable.

1.2 Document Overview

The document is structured as follows:

- Section 2 – References.
- Section 3 – Terms and Definitions.
- Section 4 – Abbreviations.
- Section 5 – Informative section providing a general overview of RST E-UE Provisioning.
- Section 6 – Normative section providing the RST E-UE Provisioning requirements.
- Annex A – RST E-UE Provisioning Data Model (normative).
- Annex B – RST E-DVA Provisioning Data Model (normative).

1.3 Requirements

Throughout this document, the words that are used to define the significance of particular requirements are capitalized. These words are:

"MUST"	This word means that the item is an absolute requirement of this specification.
"MUST NOT"	This phrase means that the item is an absolute prohibition of this specification.
"SHOULD"	This word means that there may exist valid reasons in particular circumstances to ignore this item, but the full implications should be understood and the case carefully weighed before choosing a different course.
"SHOULD NOT"	This phrase means that there may exist valid reasons in particular circumstances when the listed behavior is acceptable or even useful, but the full implications should be understood and the case carefully weighed before implementing any behavior described with this label.
"MAY"	This word means that this item is truly optional. One vendor may choose to include the item because a particular marketplace requires it or because it enhances the product, for example; another vendor may omit the same item.

2 REFERENCES

2.1 Normative References

In order to claim compliance with this specification, it is necessary to conform to the following standards and other works as indicated, in addition to the other requirements of this specification. Notwithstanding, intellectual property rights may be required to use or implement such normative references.

3 TERMS AND DEFINITIONS

This specification uses the following terms:

Cable Modem	A DOCSIS-compliant devise which provides data transport connectivity from RFI to IP networks.
Configuration	Configuration is the process of defining and propagating data to network elements for providing services.
Data Model	An abstract model that describes representation of data in a system.
eCM	The logical DOCSIS CM component of a E-UE, complies with DOCSIS, eDOCSIS and PacketCable requirements.
Embedded User Equipment	Contains the interface to a physical voice device, a network interface, CODECs, and all signaling and encapsulation functions required for VoIP transport, class features signaling, and QoS signaling.
eUE	The logical PacketCable UE component of an E-UE, complies with eSAFE and PacketCable requirements.
E-UE	Embedded User Equipment. A single physical device embedded with an eDOCSIS-compliant DOCSIS Cable Modem and a PacketCable eUE.
Management	Management refers to the protocols, methodologies and interfaces that enable oversight services in a Service Provider Network.
Management Information Base	The description of the data items used by the Network Management for management and configuration of the PacketCable compliant E-UE. Such description is done based on the formal meta-language SMI defined by the corresponding IETF standards.
Network Management	The functions related to the management of data across the network.
Provisioning	Provisioning refers to the processes involved in the initialization of user attributes and resources to provide services to a User. This involves protocols, methodologies, and interfaces to network elements such as: Order Entry and Workflow Systems that carry out business processes, Operational Support Elements that handle network resources, Application Servers that offer services and Use Equipment that offer services.
Request for Comments	Request for Comments. Technical policy documents approved by the IETF, which are available on the World Wide Web at http://www.ietf.cnri.reston.va.us/rfc.html.

4 ABBREVIATIONS AND ACRONYMS

This specification uses the following abbreviations:

CM	Cable Modem.
DOCSIS®	Data-Over-Cable Service Interface Specifications
E-DVA	Embedded Digital Voice Adaptor
MIB	Management Information Base
RFC	Request for Comments
RFI	Radio Frequency Interface
RST	Residential SIP Telephony
SNMP	Simple Network Management Protocol

5 OVERVIEW

PacketCable is a CableLabs specification effort designed to support the convergence of voice, video, data, and mobility technologies. The PacketCable architecture describes a set of functional groups and logical entities, as well as a set of interfaces that support the information flows exchanged between entities. For more information about PacketCable, please refer to the PacketCable Architecture Framework Technical Report [ARCH-FRM].

As part of these efforts, PacketCable specifies applications built upon the PacketCable architecture. One such application is RST. This document describes the configuration and management requirements applicable to Embedded User Equipment (E-UE) supporting the RST application. Within the context of this document, any reference to an E-UE (or eUE) needs to be interpreted as an E-UE (or eUE) that supports the RST application, sometimes referred to as an RST E-UE. For more information on the RST application, please refer to [RSTF].

Specifically, this document covers the following areas:

- Configuration and Management requirements for E-UEs supporting RST, including E-DVA specific requirements,
- The RST Application Data Model,
- The E-DVA Data Model for Configuration and Management.

5.1 Residential SIP Telephony

The PacketCable RST Feature specification documents an implementation of common residential telephony features in a PacketCable network, including, but not limited to: called ID, call forwarding, hold, transfer, three-way calling, emergency calling, and operator service. For more information, please refer to [RSTF].

5.2 E-UE Provisioning Framework

The PacketCable E-UE Provisioning Framework Specification [EUE-PROV], together with the E-UE Provisioning Data Models Specification [EUE-DATA], documents interfaces, protocols, and data models to support configuration and management of E-UEs in a PacketCable network. Those documents require PacketCable application specifications, such as RST, to utilize these interfaces and extend the data models as required to support the specified features.

5.3 RST E-UE

The E-UE, by definition, is an embedded PacketCable device, as specified in [EUE-PROV]. The RST E-UE is an E-UE that supports the PacketCable RST application. RST E-UEs require RST specific data to be configured and have additional requirements, as specified in this document.

6 PACKETCABLE RST E-UE ARCHITECTURE AND REQUIREMENTS

This section presents the normative requirements for RST E-UE Provisioning, using the PacketCable E-UE Provisioning Framework. It includes references to the framework and any necessary enhancements to support the RST application. For more information on PacketCable E-UE Provisioning Framework please refer to [EUE-PROV].

The E-UE consists of two components: the eCM and the eUE. For more information on the eCM configuration and management requirements for PacketCable, please refer to [EUE-PROV]. The eUE Provisioning Framework Architecture, based on the Provisioning Framework, is specified in Section 6.1. The component requirements and other enhancements are listed in the following sub-sections.

6.1 eUE Provisioning Framework Architecture

Figure 1 represents the network components and interfaces that form the eUE Provisioning Framework, the basis for RST eUE provisioning.

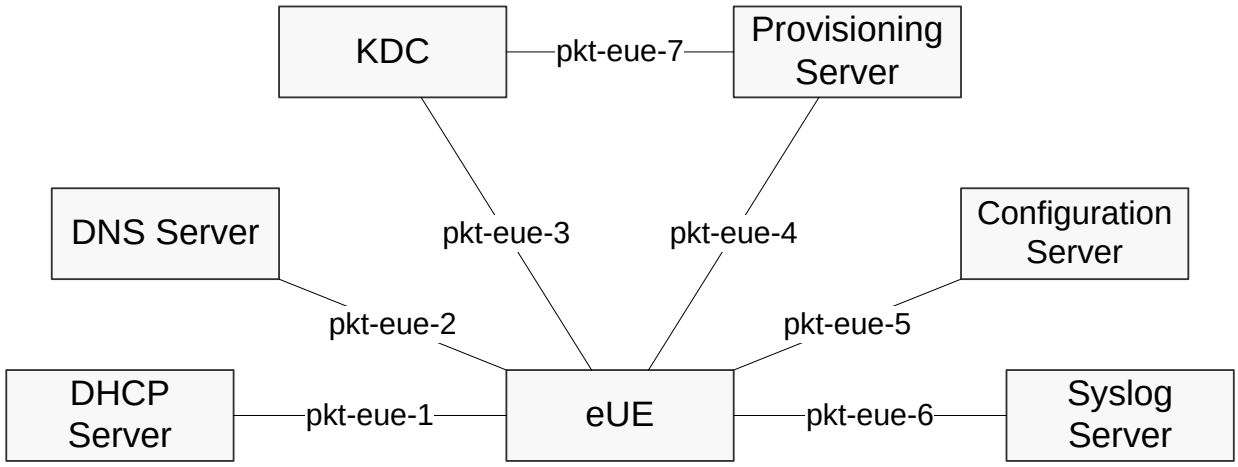

Figure 1 - E-UE Provisioning Components and Interfaces

6.2 RST E-UE Provisioning Components

This section details the network components that utilize the interfaces specified in Section 6.1, and the associated requirements. It also summarizes the additional requirements required by this framework for the DOCSIS elements to support the framework specified by this document.

6.2.1 RST E-UE

The RST E-UE MUST comply with all the E-UE requirements specified in [EUE-PROV].

6.2.1.1 eCM

An eCM embedded within the RST E-UE MUST comply with all the eCM requirements specified in [EUE-PROV] and any additional requirements specified in this document, such as impact analysis reporting.

6.2.1.2 eUE

For an eUE embedded within the RST E-UE, the following requirements apply:

- The eUE MUST support all the RST Feature requirements described in [RSTF].
- The eUE MUST adhere to all requirements described in [EUE-PROV].
- The eUE MUST comply with the requirements of the E-UE Provisioning Data Models Specification [EUE-DATA], and the RST data model specified in this document.

6.2.2 E-DVA Requirements

An Embedded Digital Voice Adapter (E-DVA) is an RST E-UE that conforms to the requirements specified in [E-DVA]. The following requirements apply:

- An E-DVA MUST comply with all the RST E-UE provisioning requirements specified in this document, and additional requirements specified in this document.
- An E-DVA MUST comply with the E-DVA data model specified in Annex B.

6.2.2.1 Interfaces Group MIB "ifTable" Requirements

The Interfaces Group MIB (IF-MIB) is defined in [RFC 2863] and required by [EUE-DATA]. The following E-DVA requirements apply:

- An E-DVA's ifTable MUST contain information about all of its endpoints.
- The E-DVA MUST start the endpoint numbering with a ifIndex value of 9, be incremented sequentially, and match the physical numbering of the telephony endpoints (indices 2 through 8 are reserved for future use and the usage of index 1 is described below).
- Each instance of the endpoint in an E-DVA MUST have a corresponding entry ("conceptual row") in the "ifTable" MIB Table.

Further, the E-DVA MUST use the following conceptual columns for each "conceptual row" in the "ifTable":

- "ifIndex"
- "ifDescr"
- "ifType"
- "ifAdminStatus"
- "ifOperStatus"

The E-DVA MUST also ensure that each conceptual row in "ifTable" that corresponds to a telephony endpoint conforms to the "IANAifType-MIB" definition for the PacketCable interface type, as follows:

- "ifType" – voiceOverCable (198)
- "ifDescr" – "Voice Over Cable Interface"

An ifIndex value of 1 is used to recognize the eCM which the E-DVA is logically connected. Refer to [EUE-DATA] for more information.

6.2.2.2 Mapping of Users to Endpoints

PacketCable allows for the configuration of MPUs on E-UEs. This is accomplished via the E-UE User MIB, specifically the MIB table 'pktcEUEUsrIMPUTable'. For more information regarding 'pktcEUEUsrIMPUTable' refer to [EUE-DATA]. For an E-DVA, additional information is required to specify the association of an IMPU with one or more endpoints if the E-DVA is configured with RST features. This information would allow an E-DVA to determine the endpoints that are affected when it receives an inbound request for a specific IMPU, or the IMPU to use when the end-user invokes RST features from an E-DVA endpoint.

The indicated additional information is provided using specific keyword-value pairs within the MIB Object titled 'pktcEUEUsrIMPUAdditionalInfo'. This MIB object is part of the MIB table 'pktcEUEUsrIMPUTable'. For the configuration of an E-DVA, the following keyword-values pairs are specified:

- IEP#:<comma-separated list of endpoints>
- OEP#:<comma-separated list of endpoints>

The keyword IEP (shortened form representing "Inbound EndPoints") indicates that an inbound request for the IMPU (for which the additional information is being provided) is to apply to one or more of the endpoints listed in the associated value. The keyword OEP (shortened form representing "Outbound EndPoints") indicates that when any of the endpoints listed in the value are used to initiate RST features (e.g., dialog-initiating requests) then the applicable IMPU (for which the additional information is being provided) is to be used.

As an example, consider an E-DVA associated with two IMPUs, sip:user1@example.com and sip:user2@example.com, with the following (partial) configuration:

- Value of the MIB object pktcEUEUsrIMPUAdditionalInfo for sip:user 1@example.com is IEP#9,10;OEP#9
- Value of the MIB object pktcEUEUsrIMPUAdditionalInfo for sip:user 2@example.com is IEP#10;OEP#10

The E-DVA interprets this as follows:

- Any inbound message for the IMPU sip:user1@example.com will apply to endpoints 9 and 10
- Any inbound message for the IMPU sip:user2@example.com will apply to endpoint 10
- Any outbound requests from endpoint 9 will use the IMPU sip:user1@example.com
- Any outbound requests from endpoint 10 will use the IMPU sip:user2@example.com

If one or more endpoints on an E-DVA are associated with RST features, the E-DVA needs to be configured with one or more IMPUs using the keyword-value pairs indicated in this section. If an endpoint is not associated with any IMPUs, then the E-DVA MUST NOT enable RST features on that endpoint. If an endpoint is associated with one or more IMPUs, then the E-DVA MUST support the enabled RST features on that endpoint.

If there are multiple outbound IMPUs indicated for an endpoint, then the E-DVA MUST consider the first occurrence (lowest index in the MIB table 'pktcEUEUsrIMPUTable') as the outbound IMPU and report the additional IMPUs as part of the warnings pertaining to eUE configuration.

As an example, consider an E-DVA associated with two IMPUs, sip:user1@example.com and sip:user2@example.com, with the following (partial) configuration:

- Value of the MIB object pktcEUEUsrIMPUAdditionalInfo for sip:user 1@example.com is IEP#9,10;OEP#9
- Value of the MIB object pktcEUEUsrIMPUAdditionalInfo for sip:user 2@example.com is IEP#10;OEP#9

Assuming that sip:user1@example.com has a lower index value within the MIB table 'pktcEUEUsrIMPUTable', the E-DVA interprets this as follows:

- Any inbound message for the IMPU sip:user1@example.com will apply to endpoints 9 and 10
- Any inbound message for the IMPU sip:user2@example.com will apply to endpoint 10
- Any outbound requests from endpoint 9 will use the IMPU sip:user1@example.com

6.2.3 Other Network Components

The following network components MUST comply with the requirements specified in [EUE-PROV]:

- DHCP Server
- DNS Server
- KDC
- Provisioning Server
- Configuration Server
- Syslog Server

In addition, the Configuration Server MUST allow for the Data Models specified in this document to RST and E-DVAs to support RST E-UEs and E-DVAs, respectively. The Syslog Server MUST support any RST specific management events specified in this document.

6.3 RST E-UE Provisioning Flows, Configuration and Management

Apart from the additional data models, this document does not enhance the E-UE requirements related to provisioning flows, configuration, and management, as specified in [EUE-PROV].

6.4 RST Data Models

This document specifies two data models, the RST Data Model in Annex A, and the E-DVA Data Model in Annex B. Further, the RST Data Model provides an RST Profile Table, as required by [EUE-DATA].

6.4.1 Operator Specific Features

The [RSTF] specification defines a reserved area for operator specific features IDs.

As defined in [RSTF] the operator feature identifier space provides flexibility to enable custom Digit Map enforcement. The EUE MUST treat a Feature ID values in the range 100 to 200 as Operator Specific Features [RSTF].

As with other RST features, this capability is configured by creating an instance in the pktcEUERSTAppProfileToFeatTable. Table 1 provides an example for operator feature configurations of the pktcEUERSTAppProfileToFeatTable.

Table 1 - Operator Specific Features Data Configuration in pktcEUERSTAppProfileToFeatTable

MIB Object	Value	Observations
pktcEUERSTAppProfileIndex	n	The index associated with an application profile
pktcEUERSTAppFeatIndex	n	The index of the feature instance for this application profile
pktcEUERSTAppFeatID	ID value	A value in the range 100 to 200
pktcEUERSTAppFeatIndexRef	0	Value zero indicates no linkage with a feature extended configuration table. Operator specific features might define their own extensions outside this specification.
pktcEUERSTAppAdminStat	'active','inactive'	The operator desired operational state of the custom feature
pktcEUERSTAppAdminStatInfo	any text	Per object definition
pktcEUERSTAppOperStat	'active', 'inactive'	Per object definition
pktcEUERSTAppOperStatInfo	zero-length or any text	Not used or vendor specific.
pktcEUERSTAppStatus	RowStatus	Per object definition

6.5 RST E-UE Additional Features

6.5.1 eDOCSIS Impact Analysis Reporting

The E-UE Provisioning Framework [EUE-PROV] requires PacketCable applications to specify the impact levels and reporting requirements. For PacketCable RST, this is specified in this section.

An application supported on an endpoint is considered impacted when an endpoint is 'active'. An RST eUE MUST consider an endpoint to be 'active' if any of the following conditions are met:

- The endpoint is off-hook,
- The endpoint is initiating or terminating telephony sessions only (e.g., SIP subscriptions for call features is not considered a telephony session).

Further, the following requirements apply:

- The eCM MUST report an impact level of 'significant' for the eUE when any of the UE's endpoints are 'active.'
- The eCM MUST report an impact level of 'none' for the eUE when none of the UE's endpoints are 'active.'

6.5.2 Incremental Provisioning

The RST E-UE MUST support post-initialization incremental provisioning as specified in [EUE-PROV], including changes to User status and application feature activation status.

6.5.3 User Registration and Configuration

The eUE MUST register every active User provided via configuration, if associated with the RST application. This is required to support RST features. Refer to [PKT-24.229] for more information about registration. For more information about User configuration and activation, please refer to [EUE-DATA]. If the IMPI related information is modified, the eUE MUST follow any applicable procedures specified in [PKT-24.229].

Additionally, for each registered User, the RST eUE MUST apply RST application settings as provided via configuration, or default values.

RST Dynamic Feature Data is not specified within this document. Please refer to [RSTF] for more information.

6.5.4 RST eUE Capabilities

In addition to the capabilities reporting via DHCP that is specified in [EUE-PROV] the RST eUE MUST report the following RST related capabilities, per [PKT-PROV1.5], along with any indicated enhancements:

- TLV 5.11 – Supported CODECs, with the following codec additions:

  16: AMR

  17: SMV

  18: EVRC

  19: G.722

  20: BV32

  21: AMR-WB

  22: VMR-WB
- TLV 5.12 – Silence Suppression Support
- TLV 5.13 – Echo Cancellation Support
- TLV 5.19 – T38 Version Support
- TLV 5.20 – T38 Error Correction Support
- TLV 5.25 – V.152 Support

pktcEUERSTAppOperStat  OBJECT-TYPE
    SYNTAX      PktcEUETCOperStatus
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        " This MIB Object contains the operational activation status
          of a feature within a profile.
```

```
          This object returns the following values:

          'active'
          When pktcEUERSTAppAdminStat is 'active' and there are
          no run-time conditions and/or configuration errors that
          prohibit the feature from being used.

          'inactive'
          When pktcEUERSTAppAdminStat is 'inactive'
          or
          When pktcEUERSTAppAdminStat is 'active' and there
          are run-time conditions and/or configuration errors
          that prohibit the feature from being used.

          'notPresent'
          When the application feature is not available or unknown
          to the EUE.

          'unknown'
          Other conditions not covered by the previous values.

          An example of a run-time condition that can result in a value
          of 'inactive' is an unsuccessful attempt to bind the resources
          associated with the feature by an application because the
          resources are currently bound to another profile.

          PacketCable applications can specify additional conditions for
          how an application is considered 'active', 'inactive' or
          'notPresent', and corresponding state machine."

pktcEUERSTAppStatus  OBJECT-TYPE
    SYNTAX      RowStatus
    MAX-ACCESS  read-create
    STATUS      current
    DESCRIPTION
        " This MIB Object defines the row status associated with this
          particular application profile in the MIB table.

          An entry in this table is not qualified for activation
          until the object instances of all corresponding columns
          have been initialized, either by default values or via
          explicit SET operations.  Until all object instances in
          this row are initialized, the status value for this realm
          must be 'notReady(3)'.

          In particular, two columnar objects must be SET: the
          'pktcEUERSTAppFeatID' and 'pktcEUERSTAppFeatIndexRef'.
          Once these two objects have been set the row status may be SET
          to 'active(1)'.

          The EUE MUST not allow these two objects to be changed while
          the row is 'active'. The value of this object has no effect on
```

```
          whether other columnar objects in this row can be modified."

    DESCRIPTION
        " This MIB Object contains the list of the voice and/or video
          codecs preferred by the network.
          The value in this object is formed as a comma-separated list
          of the well-known literal voice/video codec names in order
          of preference from left to right. The EUE MUST use the literal
          voice and/or video codec name as per RTP AV Profile
          [RFC 3551], or per encoding names registered with the IANA,
          or per encoding names referenced or defined in the PacketCable
          Codec-Media specification.
          Unknown or non-supported codecs are ignored.
          The zero-length string indicates the preferred codec list is
          vendor specific starting with G711 codecs."

pktcEUERSTCIDDisDSTInfo OBJECT-TYPE
    SYNTAX      SnmpAdminString
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
        " The time zone option including DST information in the
         'TZ-Posix String' format as defined in RFC 4833.
          If this attribute is not the zero-length string the UE MUST
          perform the time correction during the daylight saving time
          per this value and ignore the value of
          pktcEUERSTCIDDisDSTFlag and pktcEUERSTCIDDisTimeAdj

          If not configured, this attribute takes the value of the
```

```
          timezone acquired by the host system the UE resides or
          defaults to the zero-length string. For example, an
          EUE reports the value of the TZ-Posix string
          provided in RFC 4833 DHCPv4 option 'TZ-POSIX String' or
          DHCPv6 option code OPTION_NEW_POSIX_TIMEZONE from the CM.

          The following clarifications apply to the 'TZ-Posix String'
          expression:
          Given the TZ-Posix String as :
          stdoffset[dst[offset][,start[/time],end[/time]]]

          The EUE may ignore the time zone abbreviation associated with
          the 'std' and 'dst' expressions or may use them as part of a
          particular time output formatting (e.g., display time with time
           zone local abbreviation).
          The EUE is not required to support the parsing of the 'start'
          and 'end' expressions in Julian and zero-based Julian day.
          The EUE MUST apply the default values to the optional
          components in the TZ-Posiz String."

    DESCRIPTION
        " This MIB Object specifies whether call transfer can be invoked
        only when the 1st call leg was an incoming call.

        If set to 'true' call transfer can be invoked only if the 1st call
        leg was an incoming call.
```

```
        If set to 'false' call transfer can be invoked if the 1st call leg
        was an incoming or an outgoing call.

        The EUE MUST use the default value of 'false'."

    SYNTAX INTEGER {
                    onHook (1),
                    onHookWithActivity(2),
                    offHook (3)
    }
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        " This object indicates the state of an endpoint with respect
          to the hook state and, potentially, to the 'significant
          activities', which should not be interrupted by the
          network operations.

          The E-DVA MUST consider the following activities as significant:
          - tones generated by the end-point in response to an incoming
          SIP requests,
          - loopback tests.

          The E-DVA MUST set the value of this object according
          to the following:

            - onHook(1): when endpoint is 'on hook' and there are
          no 'significant activities' going on this endpoint;

            - onHookWithActivity(2): when endpoint is 'on hook' and
          there is at least one of the 'significant activities' going
          on for this endpoint;

            - offHook(3): when the endpoint is 'off hook'.
```

```
          When this object indicates the value of the
          onHookWithActivity(2) or offHook(3), the Management Station
          has to refrain from  initialization of network operations,
          that may interrupt the significant activities on the endpoints."

        required(1),
        supported(2),
        disabled(3)
        }
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
        " This MIB object is used to configure
          the QoS preconditions for the end point.

          The QoS precondition procedures are defined in RFC 3312.
          When using QoS preconditions procedures during session
          establishment, the E-DVA MUST assume that the local upstream
          and downstream QoS resources for the session are already
          allocated.

          When the E-DVA is configured as 'required'
          the E-DVA MUST establish media sessions using the QoS
          preconditions procedures.
          If the remote endpoint does not support QoS preconditions,
          the session establishment fails. Otherwise the communication
          is established using preconditions.

          When the E-DVA is configured as 'supported'
          the E-DVA MUST establish media sessions using the QoS
          preconditions procedures only when interworking with a
          remote endpoint that requires QoS preconditions to be used
          in order to complete session establishment.
          If the remote endpoint does not require the use of QoS
          preconditions (e.g., remote endpoint does not support QoS
          preconditions or indicates them as optional), then the E-DVA
          MUST establish the communication without using QoS
          preconditions.

          When the E-DVA is configured as 'disabled'
```

```
          the E-DVA MUST NOT use the QoS preconditions procedures during
          session establishment (i.e., acting as if QoS preconditions were
          not supported). If the remote endpoint requires the
          use of QoS preconditions, then session establishment fails.

          Below are the E-DVA application of the preconditions procedures.

          Precondition E-DVA Preconditions   Other endpoint   Call
          MIB Object   strength-tag          Preconditions    Result
          value                              strength-tag
          ============================================================
          'required'   mandatory             mandatory        P
          'required'   mandatory             optional         P
          'required'   mandatory             none             CF

          'supported'  optional              mandatory        P
          'supported'  optional              optional         NP

    ::= { pktcEDVALocInfoProfile 2 }

pktcEDVALocationInfo OBJECT-TYPE
    SYNTAX PktcEUETCLocInfo
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        " This object contains the Location Information data which specifies
          the location of the UE. The information on the UE location can be
          delivered to the UE via DHCP. In this case, this object contains
          the information delivered via DHCP.

          In cases when the location information cannot be delivered  via
          DHCP, the object can be changed from the configuration file only.

          The type of the Location Information and, correspondingly, the
          format of the data in this MIB object is defined by the content
          of the pktcEDVALocationInfoType MIB Object.

          For privacy reasons the UE MUST make not visible the
          pktcEDVALocInfoProfile oid sub-tree in any UE predefined SNMP view
          name. A Manager interested on exposing this object can toggle the
```

```
          inclusion of this subtree via configuration."

Appendix I Acknowledgements

CableLabs wishes to thank the PacketCable PACM focus team participants for various contributions and efforts that led to the development of this specification. Specifically:

- Eugene Nechamkin (Broadcom)
- Thomas Clack (Broadcom)
- John Berg (CableLabs)
- Sumanth Channabasappa (CableLabs)
- Josh Littlefield (Cisco)
- Satish Kumar (Texas Instruments)

Special appreciation is extended to Eugene in his role as the primary editor, Josh for revisions to the original draft, and Thomas in his role as the primary MIB author. Appreciation is also extended to John and Satish for their RST data modeling efforts.

Eduardo Cardona and the PacketCable Architects, CableLabs, Inc.

Appendix II Revision History

The following Engineering Change Notices were incorporated into PKT-SP-RST-EUE-PROV-I02-080710.

ECN	Date Accepted	Summary
RST-EUE-PROV-N-08.0506-5	5/27/2008	Updates to the EUE-EDVA MIB
RST-EUE-PROV-N-08.0525-5	5/27/2008	RST EUE MIB Alignment with PacketCable 1.5

The following Engineering Change Notices were incorporated into PKT-SP-RST-EUE-PROV-I03-090528.

ECN	Date Accepted	Summary
RST-EUE-PROV-N-08.0529-5	12/8/2008	Updates to the RST EUE MIBs
RST-EUE-PROV-N-09.0558-3	4/27/2009	Additions and clarifications to RST-EUE-PROV requirements

The following Engineering Change Notices were incorporated into PKT-SP-RST-EUE-PROV-I04-100120.

ECN	Date Accepted	Summary
RST-EUE-PROV-N-09.0607-3	11/30/2009	Clarifications on QoS Preconditions
RST-EUE-PROV-N-09.0608-4	12/14/2009	Enhancements and Clarifications for the RST Provisioning specification

The following Engineering Change Notice was incorporated into PKT-SP-RST-EUE-PROV-I05-100527.

ECN	Date Accepted	Summary
RST-EUE-PROV-N-10.0630-3	4/26/2010	Updates to Speed Dial Local Map configuration

The following Engineering Change Notice was incorporated into PKT-SP-RST-EUE-PROV-I06-110127.

ECN	Date Accepted	Summary
RST-EUE-PROV-N-10.0653-4	1/4/2011	Provisioning impact to diverse number of RST-F

The following Engineering Change Notice was incorporated into PKT-SP-RST-EUE-PROV-I07-120412.

ECN	Date Accepted	Summary
RST-EUE-PROV-N-12.0675-2	3/5/12	MIB Object to control EUE Call Transfer Logic

The following Engineering Change Notices were incorporated into PKT-SP-RST-EUE-PROV-I08-121030.

ECN	Date Accepted	Summary
RST-EUE-PROV-N-12.0687-1	7/16/2012	Compliance of CL-PKTC-EUE-RST-MIB Module with European requirements
RST-EUE-PROV-N-12.0688-2	8/13/2012	Plan Loss Configuration updates in RST-EUE-PROV
