DISCLAIMER

This document is published by Cable Television Laboratories, Inc. ("CableLabs®").

CableLabs reserves the right to revise this document for any reason including, but not limited to, changes in laws, regulations, or standards promulgated by various agencies; technological advances; or changes in equipment design, manufacturing techniques, or operating procedures described, or referred to, herein. CableLabs makes no representation or warranty, express or implied, with respect to the completeness, accuracy, or utility of the document or any information or opinion contained in the report. Any use or reliance on the information or opinion is at the risk of the user, and CableLabs shall not be liable for any damage or injury incurred by any person arising out of the completeness, accuracy, or utility of any information or opinion contained in the document.

This document is not to be construed to suggest that any affiliated company modify or change any of its products or procedures, nor does this document represent a commitment by CableLabs or any cable member to purchase any product whether or not it meets the described characteristics. Nothing contained herein shall be construed to confer any license or right to any intellectual property, whether or not the use of any information herein necessarily utilizes such intellectual property. This document is not to be construed as an endorsement of any product or company or as the adoption or promulgation of any guidelines, standards, or recommendations.

Document Status Sheet

Document Control Number:	OC-SP-OCUR-I11-130607			
Document Title:	OpenCable Unidirectional Receiver			
Revision History:	I01 – Released January 9, 2006 I02 – Released February 10, 2006 I03 – Released April 13, 2006 I04 – Released June 22, 2006 I05 – Released October 31, 2006 I06 – Released November 13, 2007 I07 – Released June 20, 2008 I08 – Released November 14, 2008 I09 – Released May 7, 2010 I10 – Released September 10, 2010 I11 – Released June 7, 2013			
Date:	May 2013			
Status:	Work in Progress	Draft	Issued	Closed
Distribution Restrictions:	Author Only	CL/Member	CL/Member/Vendor	Public

Key to Document Status Codes:

Work in Progress	An incomplete document, designed to guide discussion and generate feedback that may include several alternative requirements for consideration.
Draft	A document in specification format considered largely complete, but lacking review by Members and vendors. Drafts are susceptible to substantial change during the review process.
Issued	A stable document, which has undergone rigorous member and vendor review and is suitable for product design and development, cross-vendor interoperability, and for certification testing.
Closed	A static document, reviewed, tested, validated, and closed to further engineering change requests to the specification through CableLabs.

Trademarks

CableLabs® is a registered trademark of Cable Television Laboratories, Inc. Other CableLabs marks are listed at <http://www.cablelabs.com/certqual/trademarks>. All other marks are the property of their respective owners.

1 INTRODUCTION

1.1 OpenCable Overview

The goal of the OpenCable specifications is to define the first of a new generation of host devices that are interoperable across cable systems in North America. Information is presented in this document in order to help define the range of capabilities and applications to be supported by an OpenCable Unidirectional Receiver (OCUR). Information on the OpenCable Project can be obtained from the OpenCable website at <http://www.opencable.com>.

The OpenCable specifications:

1. Provide for integrated environments for broadcast services (analog and digital) and real-time interactive multimedia services, including IP data services (program synchronous and asynchronous), IP voice communications, video telephony, and on-demand interactive applications. Multiple models of OpenCable Host Devices are expected to co-exist within any given system, allowing the network operator to offer various services.
2. Require openness and interoperability. OpenCable takes advantage of “open” computing and network architectures, wherever possible, to minimize costs and maximize the ability to include new technologies as they become available and affordable. “Open” is defined as adherence to an international standard, North American standard, or published *de facto* industry standard. In all cases, the acquisition of the necessary software, hardware, and intellectual properties will be achievable at fair and reasonable costs. All standard interfaces will be in the public domain or, if such technology standards are to be defined, they will be available for license at a fair and reasonable cost. Closed proprietary systems are to be avoided.
3. Require portability. Retail availability of cable navigation devices is required in compliance with the FCC’s 1996 Telecom Reform Act. The OpenCable system permits “point-of-deployment decisions” for network, security, and operator-programmed user interfaces to enable the anticipated variety of retail devices.
4. Define a renewable and replaceable core encryption system called the CableCARD™ device.
5. Provide cable Multiple System Operators (MSOs) the ability to inform the navigation device (Host) of the services (video, Internet, etc.) that are offered.
6. Present a migration path from uni-directional to bi-directional networks and from broadcast to real-time interactive applications. Media servers and the related hardware (e.g., disk storage, switch fabric, modulators) will support the incremental addition of the required components to preserve any existing investment while taking advantage of more cost-effective solutions. In addition, the system software will be designed to scale efficiently as more interactive applications are added and service offerings expand. Of particular note are “authentication” and “name” services, database services, fault tolerance, and recovery mechanisms.
7. Allow efficient application and network design by:
 - Improving quality of service and/or reducing the bit rate of a digital stream through improved compression and transmission technologies; for example, by using improved MPEG-2 encoders and higher constellation digital modulation techniques.
 - Optimizing the use of network capacity. During the broadcast applications phase, bandwidth is allocated to accommodate broadcast digital program streams. As systems migrate to real-time interactive applications, the system will make efficient use of the network resources by dynamically allocating bandwidth.
 - Developing applications designed to use network resources efficiently, varying their behavior according to the network’s resource availability.
 - Minimizing the network resources required when the consumer “turns on” the terminal device.
8. Maximize compatibility with existing and/or newly-installed operational and customer support systems. All interfaces developed specifically for this effort will be integrated into the current and/or newly-installed billing support systems.

9. Co-exist with the embedded base of existing set-top devices.

1.2 OpenCable Unidirectional Cable Receiver (OCUR) Overview

This document describes the requirements for a unidirectional receiver (OCUR) Host profile.

The OCUR corresponds to a digital cable receiver with a tuner, a Card interface and an IP interface. It is intended to enable multi-user, multi-room scenarios where multiple OCURs can provide digital cable audio-visual programming over an IP connection to a Home Media Server (HMS) as shown in Figure 1.2-1.

The OCUR is connected to the home media server through a physical Digital Receiver Interface. If more than one physical Digital Receiver Interface is supported, the OCUR SHALL only enable one interface at a time. The OCUR SHALL output content only on the active Digital Receiver Interface; no other analog or digital AV outputs are permitted.

Figure 1.2-1 - OpenCable OCUR Environment

The overall protection of the cable audio-visual programming distribution across the home network is achieved through the means of a CableLabs-approved Digital Rights Management (DRM) system. All approved DRM systems need proximity control.

The OpenCable OCUR creates another content protection transition, similar to the CA-decryption/OpenCable Copy Protection encryption done within the Card, as defined in the OpenCable Digital Receiver Interface Specification [DRI]. The OCUR removes the OpenCable Copy Protection encryption, which protects the interface between the Card and any OpenCable Host device, and replaces it with a DRM protection that provides a layer of encryption at the content level persistent until the authorized consumption of that service.

Figure 1.2-2 - OpenCable Content Protection Transitions

The OpenCable OCUR securely bridges the OpenCable Copy Protection signaling to the Digital Rights Management system by exporting and enforcing the encoding rules associated to the service, as defined by the OpenCable Copy Protection Specification [CCCP].

The goals and objectives of the OCUR are:

- To receive non-scrambled analog and digital services.
- To be sold through retail channels directly to the customer.
- To receive digital premium (scrambled) cable services using a CableLabs-qualified Card.
- To enable a multi-room, multi-user home media server scenario.
- To bridge the OpenCable Copy Protection mechanism with any CableLabs-approved Digital Right Management system.

Information on the OpenCable Project can be obtained from the OpenCable website at <http://www.opencable.com/>, and information on the DOCSIS specifications can be found at the DOCSIS web site at <http://www.cablemodem.com/>.

1.3 Compliance Notation

Throughout this document, the words that are used to define the significance of particular requirements are capitalized. These words are:

“SHALL”	This word or the adjective “REQUIRED” means that the item is an absolute requirement of this specification.
“SHALL NOT”	This phrase means that the item is an absolute prohibition of this specification.
“SHOULD”	This word or the adjective “RECOMMENDED” means that there may exist valid reasons in particular circumstances to ignore this item, but the full implications should be understood and the case carefully weighed before choosing a different course.
“SHOULD NOT”	This phrase means that there may exist valid reasons in particular circumstances when the listed behavior is acceptable or even useful, but the full implications should be understood and the case carefully weighed before implementing any behavior described with this label.
“MAY”	This word or the adjective “OPTIONAL” means that this item is truly optional. One vendor may choose to include the item because a particular marketplace requires it or because it enhances the product, for example; another vendor may omit the same item.

3 TERMS AND DEFINITIONS

This document uses the following terms:

OpenCable Unidirectional Receiver	A cable receiver that does not include a return data channel or a user interface and is compatible with the profile defined by this specification.
Card	A PCMCIA card distributed by cable providers and inserted into a Host device to enable reception of premium services without a separate cable receiver, also called CableCARD Device and “Point of Deployment” (POD) module.
CA-Scrambling	Video that has been scrambled by the cable operator.
Control Stream	CA data received in a Forward Data Channel. (Sometimes referred to the OOB)
Digital Receiver Interface	A content transport and Command & Control protocol between the Unidirectional Cable Receiver and the Home Media Server implemented over an IP interface.
Digital Rights Management	A technology that controls access to services by preventing the unauthorized sharing or copying of digital content, and associating the use or viewing of content to specific individuals, operating systems, or hardware.
DRIT	Digital Receiver Interface Transcoder. OCURs are a version of DRITs.
Home Media Server	A Home Media Server is a system that employs one or more OCURs to securely store, distribute and/or render cable audio-visual programming services.

4 ABBREVIATIONS AND ACRONYMS

This specification uses the following abbreviations:

ACCI	Aggregate Content Control Instructions
AES	Advanced Encryption System
APS	Analog Protection System
CA	Conditional Access
CCI	Copy Control Information
CCCP	CableCARD Copy Protection
CGMS-A	Copy Generation Management System – Analog
DES	Data Encryption Standard
DRI	Digital Receiver Interface
DRM	Digital Rights Management
DVI	Digital Video Interface
DVS	Digital Video Subcommittee
EAS	Emergency Alert System
EPG	Electronic Program Guide
EPN	Encryption Plus Non-assertion
FAT Channel	Forward Application Transport Channel
FDC	Forward Data Channel
HMS	Home Media Server
IP	Internet Protocol
MAC	Media Access Control
MMI	Man Machine Interface
MPEG	Moving Picture Experts Group
MPTS	Multiple Program Transport Stream – as defined in ISO13818-1
NTSC	National Television System Committee
OCUR	OpenCable Unidirectional Receiver
PAT	Program Association Table
PMT	Program Map Table

RF	Radio Frequency
SCTE	Society of Cable Telecommunications Engineers
SI	System Information
SRM	A System Renewability Message that is used to revoke an instance of DRM implementation. **Note this SRM should not be confused with the SRM defined in the HDCP and DTCP specification.
SPTS	Single Program Transport Stream – as defined in ISO13818-1
STT	System Time Table
VCPS	Video Content Protection System
VGA	Video Graphics Adaptor
XDS	Extended Data Service

5 OVERVIEW OF CORE SERVICES AND FUNCTIONALITIES

5.1 OCUR components

This section describes the core services that OCURs shall support as well as the core functions required to implement those services. A block diagram of the OCUR components is shown in Figure 5.1-1.

Figure 5.1-1 - Block Diagram of the OCUR (Informative)

Operational and security components are described below:

- **A/V Encoder** – This optional block receives an NTSC signal and performs an audio/video compression operation, as defined by this specification.
- **MPEG Mux** – This block creates an MPEG-2 Single Program Transport Stream (SPTS) with consistent PSI/SI that complies with [ISO 13818-1].
 1. If the OCUR is tuned to a digital channel; this block positively filters the selected program and its associated tuning space information.
 2. If the OCUR is tuned to an analog channel; this block combines the audio and video components and creates a PAT and a PMT tables compliant with the cable channel map.
- **Channel Navigator** – This block receives channel map and emergency alert tables from the Card to provide the following services:
 1. Defines applicable tuning parameters for a DRI tune request based on virtual channel number.
 2. Defines applicable tuning parameters for a Card firmware upgrade request.
 3. Caches all Control Stream tables and forward them through the DRI connection upon request.
- **DRI Security** – This block applies a common scrambling mechanism to DRM-protected content independent of the selected DRM system and based on the AES [FIPS 197].
- **CCCP** – This block performs the task of Card authentication, CP session key generation and Copy Control Information (CCI) management as defined per [CCCP]. It provides CCI parameters to the DRM block for selection of the appropriate license.
- **Macrovision** – This optional block extracts the Macrovision state of the NTSC signal and transfers the equivalent APS bits to the DRM block. These values never conflict with the CCCP CCI states, which are only provided while tuned to a digital channel.

- **XDS** – This optional block analyses line 21 - Field 1 and 2 of the NTSC VBI interval and extracts the CGMS-A bits. The DRM system is responsible for preserving these bits in order to re-insert them on the analog outputs. These values never conflict with the CCCP CCI states, which are only provided while tuned to a digital channel.
- **DRM** – This block performs the function of a CableLabs-approved DRM transmitter.
- **DRI Command & Control Service** – This block exposes all the controls and commands to discover, reserve and use the OCUR.
- **DRI Transport Service** – This block receives an SPTS from the DRI Security block. Every transport interval, it creates an RTP/UDP packet and sends it to HMS. Optional modes based on native isochronous channels of the digital bus are also permitted.
- **DRI Eventing Service** – This block sends asynchronously all OCUR events, such as the DRM licenses, the FDC channel map tables and the Card changes of status.

5.1.1 Core Services (Informative)

The following services can be provided by the Core Requirements for OCURs:

- Optional support of NTSC audio-visual programming (unscrambled) by encoding to an SPTS as defined by this specification
- Support of digital audio-visual programming utilizing MPEG-2 main profile @ main level and main profile @ high level video and Dolby AC-3 audio including broadcast (unscrambled), subscription-based (scrambled), music channels and other services.

5.1.2 Core Functions and Features (Informative)

The features and functions of the OCUR necessary to support the core services include the following:

- Input range of 54-1002 MHz or greater, analog (optional) and digital (64/256 QAM) tuning and demodulation,
- Closed Caption detection for NTSC audio-visual programming according to [CEA-608] and conversion to [SCTE 21] for transmission across the DRI output if optional analog channel support is implemented,
- DRM content protection on DRI output [DRI],
- Emergency Alert System detection of [SCTE 18] for transmission on DRI output,
- QPSK Control Stream receiver compliant with [SCTE 55-2] and [SCTE 55-1],
- Card digital interface (see OpenCable CableCARD Interface 2.0 Specification [CCIF]) in M-Mode,
- OpenCable CableCARD Copy Protection 2.0 Specification [CCCP] in M-Mode.

5.2 General Compliance (Normative)

Any features of an OCUR mandated by law or FCC regulation (e.g., Emergency Alert System, V-Chip) SHALL be supported in the Core Requirements for all OCURs.

The OCUR manufacturer SHALL confirm compliance with all applicable FCC rules and regulations as found in [47CFR15] and [47CFR76].

The OCUR manufacturer SHALL confirm compliance with all applicable UL rules and regulations as found in Table 12-1 - Environmental / Mechanical Requirements.

The OCUR SHALL comply with the specifications described in

Table 7.3-1 - Analog and FAT Channel: RF Performance Parameters (0° - 40°C)

Table 7.3-2 - FDC Channel: RF Performance Parameters (0° - 40°C)

Table 7.3-3 - Adjacent Channel Characteristics

6 SECURITY

This section describes requirements for copy protection of video programs, security of video streams, conditional access to video streams, and security of transmitted data.

6.1 Conditional Access

The OCUR SHALL utilize the Card to perform the following Conditional Access (CA) functions as defined in [CCCP]: CA decryption, authorization, entitlement and Copy Protection encryption.

The CA Functions SHALL be implemented in the Card and not in the OCUR.

If CA functionality is present in the OCUR, it SHALL be disabled under all circumstances, including the absence of a Card.

The OCUR SHALL implement all aspects of Copy Protection binding and key generation, according to [CCCP], locally except for presentation of the MMI.

6.2 Certificate Storage and Management

The OCUR SHALL store the various certificates and any associated private/public keys as defined in sections 5.8 Host and CableCARD Certificate Storage and Management, 6.1.2 CableLabs Code Verification Root CA Certificate, 6.1.3 CableLabs Code Verification CA Certificate, and 6.1.6 CableLabs Application Code Verification CA Certificate of the OpenCable System Security Specification [OC-SEC].

If the OCUR implements more than one CHI, the OCUR SHALL have and employ a unique OpenCable Host Certificate for each CHI.

6.3 Analog Program Copy Protection

If analog channel support is implemented, the OCUR SHALL reset all analog copy protection status after a channel change.

If analog channel support is implemented, the OCUR SHALL detect the analog copy protection status of the selected NTSC channel and protect it according to Annex A.

6.4 Digital Program Copy Protection

The OCUR SHALL implement M-Mode copy protection as defined by OpenCable CableCARD Copy Protection 2.0 Specification [CCCP].

The OCUR SHALL NOT change the CCI value used to control content output except as instructed by the Card or when reset after a channel change.

The OCUR SHALL detect the digital copy protection status of the selected digital program and protect in accordance with Annex A.

6.5 DRI Content Protection

The OCUR SHALL permit output of content (except Content Types A N, D1 00, and DX 0 on the tables of Annex A) only under the effective protection of a CableLabs-approved DRM system, whose DrmUUID value is not listed in the Drm_revocation_list, in accordance with Annex B.

6.6 HMS Association Recording

The OCUR SHALL register in non-volatile memory the HMS Association parameters listed in Table 6.6-1 - HMS Association Record for the latest sixteen DRM-paired HMS devices.

Table 6.6–1 - HMS Association Record

	Parameter	# of bits	Description
1	drm_guid	128	Global Unique Identifier for the DRM system
2	hms_association_id	160	HMS / OCUR unique association identifier provided by the DRM system
3	drm_pairing_time	64	UTC time of the latest successful DRM pairing operation based on STT received from Card.

When the Card is present, the OCUR SHALL erase the HMS Association record that has the oldest `drm_pairing_time` if the maximum number of records have been filled and a new HMS device is successfully DRM-paired.

When the Card is present, the OCUR SHALL update the `hms_pairing_time` parameter every time it pairs with a registered HMS.

7 UNIDIRECTIONAL PHYSICAL LAYER CHARACTERISTICS

7.1 RF Interface

The mechanical and electrical interface between the cable plant and the OCUR SHALL be as defined in section 3 Mechanical and Electrical Interface of [CEA-23] with the additional requirements specified in the remainder of this document.

7.1.1 Maximum Individual Carrier Amplitude

The OCUR SHALL be capable of meeting the FAT and FDC channel performance requirements in the presence of interfering signals where the maximum rms value of any individual interfering signal does not exceed the following limits (measured across 75Ω):

0.5 MHz to 42 MHz +42 dBmV

42 MHz to 52 MHz 0 dBmV

52 MHz to 54 MHz -17 dBmV

The maximum rms value of any individual signal whose frequency exceeds 54 MHz is less than +20 dBmV across a 75 ohm terminating impedance measured at the input to the OCUR.

7.2 Communication Channels

The OCUR SHALL receive the following communication channels:

One or more Forward Application Transport (FAT) channels, which carry MPEG-2 Program Streams.

Forward Data Channel (FDC)

The OCUR SHALL receive all cable signals on one, and only one, RF input connector.

NOTE: Support for tuning and demodulation of NTSC signals is optional.

7.2.1 Forward Application Transport (FAT) Channel

The forward application transport channel is a 64 or 256 Quadrature Amplitude Modulation (QAM) channel according to [SCTE 07] that transports approximately 27 or 39 megabits/second, respectively. The OCUR is instructed to tune to a particular FAT channel when a subscriber requests a service that requires transport on a FAT channel. FAT channels that are present on the cable plant will adhere to the STD, HRC or IRC frequency plans of [CEA-542-B] and can be located anywhere in the 54 to 1002 MHz range.

The OCUR SHALL receive signals that are compliant with [SCTE 07] for the transmission physical layer modulation, coding, synchronization, and Forward Error Correction and present the requested data stream on the DRI connection in accordance with [DRI].

The OCUR SHALL decode the Forward Application Transport channel over the range of input parameters as defined in Table 7.3-1 - Analog and FAT Channel: RF Performance Parameters (0° - 40°C) and present the requested data stream on the DRI connection in accordance with [DRI].

The Forward Application Transport tuner SHALL have a frequency range of 54 to 1002 MHz.

7.2.2 NTSC Channels

NTSC channels will adhere to the STD, HRC or IRC frequency plans of [CEA-542-B] and can be located anywhere in the 54 to 864 MHz range.

If analog channel support is implemented, the OCUR SHALL receive and present on the DRI compliant with supported transport stream interface data rates of 26.97035 Mb/s and 38.81070 Mb/s for all existing unscrambled analog channels that meet the following conditions: NTSC RF AM-VSB modulated in accordance with FCC rules, adhering to one of the STD, HRC or IRC frequency plans of [CEA-542-B] and located in the 54 to 864 MHz range.

NOTE: It is expected that only QAM channels will be present above 864 MHz.

7.2.2.1 Vertical Blanking Interval

The Vertical Blanking Interval (VBI) contains data on line 21 of an analog television signal. During this period, the cable headend can insert VBI data signals on VBI line 21 for closed captioning. VBI data can be inserted within field 1, field 2, or both, on any analog channel operating in the 54 to 864 MHz range.

If analog channel support is implemented, the OCUR SHALL detect closed captions, text mode data services, and extended data services data contained in line 21 of the VBI (field 1 and 2) of NTSC signals as defined by [CEA-608], and convert them into [SCTE 21] format and make available on the DRI connection [DRI].

7.2.3 CA Signaling on Forward Data Channel

7.2.3.1 Forward Data Channel

The FDC receiver RF front end provides the generic QPSK physical layer common to the OpenCable choices.

The OCUR SHALL be capable of receiving a Forward Data Channel with parameters defined in [SCTE 55-1] and [SCTE 55-2] and passing the demodulated signal to the Card per [CCIF].

The OCUR SHALL receive and demodulate signals compliant with [SCTE 55-2] and [SCTE 55-1] for the FDC transmission physical layer modulation and differential coding and present the data stream on the Card interface with a bit error rate (BER) of 2.5e-06 or less.

The OCUR SHALL demodulate the Forward Data Channel over the range of input levels as defined in Table 7.3–2 - FDC Channel: RF Performance Parameters (0° - 40°C).

The Forward Data Channel tuner SHALL have a frequency range of 70 to 130 MHz and be able to tune any nominal carrier frequency defined in item 4 of Table 7.3–2 - FDC Channel: RF Performance Parameters (0° - 40°C) as directed by the Card.

The OCUR SHALL receive and demodulate digital QPSK FDC signals with a signal level that is ± 15 dBmV within the minimum channel spacing as specified in [SCTE 55-1] and [SCTE 55-2] and present the data stream on the Card interface with a bit error rate (BER) of 2.5e-06 or less.

7.3 Physical Layer Specifications

7.3.1 In-Band Downstream Channel, FDC Characteristics and RF Performance

The OCUR SHALL meet all performance requirements specified in Table 7.3–1- Analog and FAT Channel: RF Performance Parameters (0° - 40°C) and Table 7.3–2 - FDC Channel: RF Performance Parameters (0° - 40°C) while operating with the downstream transmission characteristics defined by [SCTE 40].

The OCUR SHALL use a female “F” connector meeting [SCTE 01] for the RF input.

The “F” connector for RF input on the OCUR SHALL have a “Cable In” label.

The OCUR SHALL set the transport_error_indicator field in the MPEG transport packet message as defined in [ISO 13818-1] to indicate RF transmission errors.

Table 7.3–1 - Analog and FAT Channel: RF Performance Parameters (0° - 40°C)

1.	RF Input Channel Bandwidth	6 MHz
2.	RF Input Tuning Range	54 MHz to 1002 MHz IRC/HRC/Standard Channel Plans
3.	RF Input Return Loss	6 dB minimum over full tuning range
4.	RF Input Impedance	75 ohm unbalanced
5.	RF Input Level Range	Analog visual carrier(c) from 0 dBmV minimum to +15 dBmV maximum; Analog aural carrier from -10 to -17 dBc; Digital 64 QAM signal from -15 dBmV to +15 dBmV; Digital 256 QAM signal from -12 dBmV to +15 dBmV
6.	AFC Range	Better than ± 125 kHz or nominal tuning resolution of 62.5 kHz

7.	LO Leakage (Input EMC)	-37 dBmV over 54 MHz to 1002 MHz
8.	Signal Leakage/RFI	Per [47CFR15]
9.	Group Delay Variation Tolerance	$\leq 0.25 \mu\text{sec}/\text{MHz}$ across the 6-MHz channel
10.	Phase Noise Tolerance	$\leq -88 \text{ dB}/\text{Hz}$ @ 10 kHz offset (relative to the center of QAM signal spectrum)
11.	Amplitude Ripple Tolerance: Digital channels Analog channels	$\leq 5 \text{ dB p-p}$ within the 6 MHz channel $\leq 4 \text{ dB p-p}$ within the 6 MHz channel
12.	Microreflection Tolerance (assumes one dominant echo with max. specified amplitude in dB relative to the primary QAM signal)	-10 dB at $< 0.5 \mu\text{sec}$ -15 dB at $< 1 \mu\text{sec}$ -20 dB at $< 1.5 \mu\text{sec}$ -30 dB at $< 4.5 \mu\text{sec}$ Echoes $> 4.5 \mu\text{sec}$ (see Note 1)
13.	Burst Noise Tolerance	Not longer than 25 μsec at 10 Hz repetition rate
14.	Image Rejection	Image response less than 60 dBc at final IF or baseband video output, 54 to 714 MHz Image response less than 50 dBc at final IF or baseband video output, 714 to 1002 MHz 60dB standard to apply at 714 MHz Two equal power CW signals, +15 dBmV $F_{\text{image}} = F_{\text{desired}} + 90 \text{ MHz}$
15.	Spurious Emissions, 5 – 1002 MHz	$< -37 \text{ dBmV}$

Table Notes:

1. *Micro-reflection longer than 4.5 microseconds rarely occur in conventional cable television systems. Moreover, very low-level micro-reflections (e.g., -40dB) longer than 4.5 microseconds cannot be measured reliably with readily available instruments. Studies on the subject of long Micro-reflections are continuing, which may result in quantifying this parameter at a future date.*

Table 7.3-2 - FDC Channel: RF Performance Parameters (0° - 40°C)

1.	Transmission Rate	1.544/3.088 Mbps [SCTE 55-2] 2.048 Mbps [SCTE 55-1]
2.	RF Input Channel Spacing	1.0/2.0 MHz [SCTE 55-2] 1.8 MHz [SCTE 55-1]
3.	RF Input Tuning Range	70 MHz to 130 MHz
4.	Nominal carrier frequency	Any integer multiple of 250 kHz between the minimum and maximum carrier frequencies, inclusive and the specific fixed frequency of 104.200 MHz.
5.	Frequency acquisition range	+/- 50 ppm
6.	RF Input level range	-15 to +15 dBmV rms (75 ohms) (See Note 1)
7.	Differential Encoding	The differential encoder SHALL accept bits (A, B) in sequence and generate phase changes as follows: A B Phase Change default alternative 0 0 none none 0 1 +90 deg -90 deg 1 0 -90 deg +90 deg 1 1 180 deg 180 deg
8.	Group Delay variation tolerance	200 ns max in channel, measured over Nyquist bandwidth
9.	Channel Tune / Carrier acquisition time	< 500ms

7.3.1.1 RF Signal Levels and Adjacent Channel Characteristics

7.3.1.1.1 RF Signal Levels

If analog channel support is implemented, the OCUR SHALL be capable of receiving an analog signal with a visual signal level that is within ± 3 dB of the visual signal level of any adjacent analog channel (within a 6 MHz nominal frequency separation as specified in [47CFR76]).

To determine the adjacent channel characteristics between digital and analog signals, the following information is provided. The nominal relative carrier power levels for analog and digital signals are given by:

Analog channel:	0 dBc (reference level)
256 QAM FAT:	-5 ± 2 dBc
QPSK FDC:	-8 ± 5 dBc
64 QAM FAT:	-10 ± 2 dBc

The OCUR SHALL be capable of receiving a digital signal with an average RMS signal power that is within ± 6 dB of its nominal level with respect to the nominal level of the adjacent channel digital or analog signal.

It is noted that the nominal carrier power levels provided above fall within the absolute power range for digital signals, -15 dBmV to +15 dBmV. The nominal analog signal power is measured as the peak envelope power (PEP), which is the average of all the analog RMS carrier power levels measured during horizontal sync level. The nominal digital signal power is measured as the average of all the digital RMS signal power levels.

7.3.1.1.2 Adjacent Channel Characteristics

The OCUR SHALL be capable of receiving digital signals with “Worst Case” Adjacent Channel performance as characterized in Table 7.3-3 - Adjacent Channel Characteristics.

If analog channel support is implemented, the OCUR SHALL be capable of receiving analog signals with “Worst Case” Adjacent Channel performance as characterized in Table 7.3–3 - Adjacent Channel Characteristics.

Table 7.3–3 - Adjacent Channel Characteristics

	Desired (D) Channel Modulation	Undesired (U) Adjacent Channel Modulation	Worst Case D/U Ratio*
1.	Analog NTSC	64-QAM	-1 dB
2.	Analog NTSC	256-QAM	-6 dB
3.	Analog NTSC	QPSK FDC	-6 dB
4.	64-QAM	Analog NTSC	-21 dB
5.	64-QAM	256-QAM	-21 dB
6.	64-QAM	QPSK FDC	-21 dB
7.	256-QAM	Analog NTSC	-16 dB
8.	256-QAM	64-QAM	-11 dB
9.	256-QAM	QPSK FDC	-16 dB
10.	QPSK FDC	Analog NTSC	-22 dB
11.	QPSK FDC	64-QAM	-17 dB
12.	QPSK FDC	256-QAM	-22 dB
* Independent of the D/U ratios, the C/(N+I) and the absolute signal levels range shall meet the requirements for those parameters as described elsewhere in the specification.			

7.3.1.1.3 Ranges for Digital Signals

Independently of meeting the requirements specified in Sections 7.3.1.1.1 and 7.3.1.1.2 above, the OCUR SHALL tune and receive digital signals that fall within the ranges specified in Table 7.3–1 - Analog and FAT Channel: RF Performance Parameters (0° - 40°C) (QAM signals Item 2) and Table 7.3–2 - FDC Channel: RF Performance Parameters (0° - 40°C) (QPSK FDC signals Item 3).

Independently of meeting the requirements listed in 7.3.1.1.1 RF Signal Levels and 7.3.1.1.2 Adjacent Channel Characteristics, the OCUR SHALL be capable of receiving digital 64QAM with characteristics:

Level = -10 dBmV on channel 82

Interleaver depth of greater than or equal to I=64 (J=2)

33 dB C/N

-18 dB ghost at 0.5 us

25 us burst noise not greater than -15 dBmV at 10 Hz rep rate

Independently of meeting the requirements listed in 7.3.1.1.1 RF Signal Levels and 7.3.1.1.2 Adjacent Channel Characteristics, the OCUR SHALL be capable of receiving digital 256QAM with characteristics:

Level = -7 dBmV on channel 82

Interleaver depth of greater than or equal to I=64 (J=2)

36 dB C/N

-18 dB ghost at 0.5 us

16 us burst noise not greater than -12 dBmV at 10 Hz rep rate

7.3.1.1.4 *Spurious Emissions from the OCUR*

The OCUR SHALL limit all spurious emissions according to item 15 in Table 7.3-1- Analog and FAT Channel: RF Performance Parameters (0° - 40°C).

8 CARD INTERFACE

The OCUR provides an interface to the Card to facilitate the processing of digital information, which is received over the forward application transport (FAT) channel and the forward data channel (FDC).

The interfaces between the OCUR and the Card are described in [CCIF].

The OCUR SHALL only implement the Unidirectional Host side of the Multi-Stream (M-Mode) CableCARD interface as specified in the following sections of [CCIF]:

7.0 - Physical Interface

9.0 - Command Channel Operation

10.6 - Link Layer

Annex B - Error Handling

The OCUR SHALL NOT utilize signals ITX, QTX, ETX, and CTX.

The OCUR SHALL NOT report a Low Speed Communication resource identifier.

8.1 OCUR Functionality with Unscrambled Content

The OCUR needs to function without a Card and process the information received via the NTSC and FAT channels directly.

The OCUR needs to have the following minimum performance characteristics without the Card:

If analog channel support is implemented, the OCUR SHALL encode and deliver to the DRI received analog television programming in one of the video formats defined in [SCTE 43] with audio encoded as either MPEG-1 Level 2 as defined by [ISO-13818-3] with support for the minimum configuration defined in [DRI], or AC-3 as defined by [A/53C], compliant with [DRI], and representative of the source content.

The OCUR SHALL output [SCTE 43]-compliant Content Types D0 0 and DX 0 on the DRI in compliance with Annex A.

8.2 OCUR Functionality without a Card

When the OCUR is operating without a Card, any channel map created from Control Stream data while previously operating with a Card SHALL NOT be used.

8.3 Man Machine Interface (MMI) Support

The OCUR needs to be capable of operating in a unidirectional system and support copy protection in this operational case. As defined in [CCCP], for a unidirectional system, the copy protection system performs ID reporting utilizing the MMI resource.

The OCUR SHALL support the MMI resource defined in [CCIF].

The OCUR SHALL support the MMI protocol defined in [DRI].

8.4 Software Download

The OCUR SHALL download and install a single monolithic code image to replace the OCUR's operating code based on the One-way Broadcast protocols specified in [CCIF] and security systems specified in [OC-SEC].

The OCUR SHALL receive SRM defined in Annex B based on the One-way Broadcast protocols with OOB delivered CVT, specified in [CCIF] and security systems specified in [OC-SEC].

The OCUR SHALL securely download and install a single monolithic code image to replace the OCUR's operating code delivered from the DRI.

The OCUR SHALL add into the `Drm_revocation_list` any `Drm_UUID(s)` with a `revocation_status = 01` when received through a SRM defined in Annex B.

The OCUR SHALL remove from the `Drm_revocation_list` any `Drm_UUID(s)` with a `revocation_status = 00` when received through a SRM defined in Annex B.

The OCUR SHALL store the `Drm_revocation_list` into non-volatile memory every time it is updated.

The OCUR SHALL event a URL to notify the user via the [DRI] of all DRMs it supports, whenever a DRM is added, removed, renewed or revoked as a result of software download.

8.5 Digital Receiver Interface (DRI) Output

The OCUR provides an interface to a Home Media Server that allows secure control of its navigation and security services over an IP network. Other types of analog or digital AV outputs are not permitted on an OCUR.

The Digital Receiver Interface protocol between the OCUR and a home media server is described in the OpenCable Digital Receiver Interface Specification [DRI].

The OCUR SHALL include a digital output, on which each FAT tuner will be represented as a UPnP embedded device compliant with the Digital Receiver Interface specification [DRI].

The OCUR SHALL NOT include any other OpenCable defined outputs that carry compressed or uncompressed audio and/or video.

The OCUR MAY include a USB host interface for connection of a Tuning Resolver.

Note: The UPnP device architecture document [UPnP-DA] describes how a UPnP device can be defined as an umbrella Root device hosting a number of embedded devices, each implementing the same or different functions. The Root device is nothing but a container of embedded devices, which are seen by the PC as completely independent devices.

The following xml file provides a reference implementation for two FAT tuner OCUR devices.

9 VIDEO

9.1 Analog Video

The OCUR will be introduced into an environment containing many existing analog channels. The OCUR can optionally receive analog services that are unscrambled. In this case, analog video and audio will be NTSC-decoded in accordance with current cable-system practice and applicable FCC rules.

9.2 Digital Video

The OCUR is required to handle all digital transport streams according to the requirements in the following subsections.

9.2.1 MPEG-2 Transport

The OCUR SHALL support System Information tables provided in [SCTE 65] for the navigation function.

The OCUR SHALL acquire and make available on the DRI a Digital Service contained within the same multiplex within 1.5 seconds.

The OCUR SHALL acquire and make available on the DRI a Digital Service contained within a different multiplex within 2.0 seconds.

The OCUR SHALL store the [SCTE 65] system information tables required for program navigation in non-volatile memory.

9.2.2 FAT Delivered Service/System Information

The OCUR SHALL make available upon request on the DRI connection [DRI] in-band System and Service Information for programs that are transported unscrambled in accordance with section 5.5 - Constraints on PSI of [SCTE 54].

9.2.3 Service/System Information provided by Card

The OCUR SHALL make available upon request on the DRI connection [DRI] Service/System Information provided by the Card or found In-band.

The set of MPEG-2 tables required to support the navigation function in the OCUR conforms to one or more of the profiles specified in [SCTE 65].

The OCUR SHALL be able to extract the channel map used for program navigation from all profiles specified in [SCTE 65], with the exception of Profile 6. .

The OCUR MAY be able to extract the channel map used for program navigation from Profile 6 as specified in [SCTE 65].

9.2.4 Digital Television (DTV) Closed Captioning

The OCUR SHALL make available on the DRI connection [DRI], NTSC closed captioning information, when present in line 21 of the VBI as specified in [CEA-608], in the MPEG-2 Picture Level user_data transported according to [SCTE 21].

The OCUR SHALL make available on the DRI connection [DRI], Digital Television closed captioning (DTVCC) information when present in the MPEG-2 Picture Level user_data, as specified in section 9 of [CEA-708] and transported according to [A/53C] (with *cc_type* 10 or 11).

The OCUR SHALL make available on the DRI connection [DRI] the caption_service_descriptor, as defined in [A/65B] and carried in either the PMT of the in-band MPEG-2 transport stream or passed across the Card Extended Data Channel according to [CCIF].

9.2.5 Digital Television (DTV) Content Advisory Information

To support the interoperable availability of content advisory information for OCURs and/or Cards, OpenCable specifies the use of MPEG-2 Picture Level user_data found in [SCTE 21], the content_advisory_descriptor passed

across the Extended Data Channel, or the content_advisory_descriptor found in section 6.7.4 of [A/65B]. The syntax follows Table 6.18 in that reference. This descriptor is placed in the Program Map Table (PMT) as permitted in Table 6.16 of [A/65B] in accordance with the standard descriptor mapping for the TS_program_map_section() found in [ISO 13818-1].

The only rating region currently defined for OpenCable use is Region One (value 0x01 for the rating_region field). Semantics for the coding of the fields found in the PSIP Content Advisory Descriptor follow the rules given in section 6.74 of [A/65B].

The OCUR SHALL make available on the DRI connection [DRI] content advisory information as specified in [CEA-608] when such information is transported according to [SCTE 21] or [SCTE 20].

If analog channel support is implemented, the OCUR SHALL convert and make available on the DRI any [CEA-608] NTSC content advisory information as an [A/65B] compliant content_advisory_descriptor in PMT tables as defined in Table 9.2-1- Content advisory conversion table.

Table 9.2-1 - Content advisory conversion table

ATSC Descriptor			608B Descriptor	
Rated_Dimension	Rating_region	Rating_value	Rating Level	Attributes
0	US_TV	1	US_TV_None	
		2	US_TV_G	
		3	US_TV_PG	
		4	US_TV_14	
		5	US_TV_MA	
1	US_TV	1		Sexually Suggestive Dialog
2	US_TV	1		Adult Language
3	US_TV	1		Sexual Situation
4	US_TV	1		Violence
5	US_TV	1	US_TV_Y	
		2	US_TV_Y7	
6	US_TV	1		Fantasy Violence
7	MPAA	1	MPAA_NotApplicable	
		2	MPAA_G	
		3	MPAA_PG	
		4	MPAA_PG13	
		5	MPAA_R	
		6	MPAA_NC17	
		7	MPAA_X	
		8	MPAA_NotRated	

The OCUR SHALL make available on the DRI connection [DRI] the content advisory information as defined by [A/65B] and [CEA-766-A] when such information is transported in either the PMT of the in-band MPEG-2 transport stream or passed across the Card Extended Data Channel according to [CCIF].

The OCUR SHALL have the U.S. RRT (Region Rating Table for Region One) defined in [CEA-766-A] either embedded as part of the firmware or stored in non-volatile memory, such that the table is always available for use when needed.

The U.S. RRT SHALL be the default RRT for all OCURs. It is noted that this approach is consistent with that specified in Annex C.1 of [SCTE 65].

9.2.6 Digital Television (DTV) Emergency Alert Service (EAS)

The OCUR SHALL make available on the DRI connection [DRI] EAS messages as defined in [SCTE 18].

The OCUR SHALL make available on the DRI connection [DRI] any EAS message found In-Band upon proper initialization of the Mux Service.

10 OCUR POWERING STATES

Once the OCUR has power applied and has performed Card installation and initialization, it always has access to cable network services through the Control Stream channel for receipt of messages, alarms, or notifications. Thus, when the OCUR is “On” (from the subscriber’s perspective), it is fully active and providing services to the connected HMS. When it is “Off”, it still maintains cable network connectivity and thus is still consuming power and running the processor, operating system, and navigator shell.

The OCUR SHALL re-acquire the FDC after being disconnected from and then reconnected to power.

The OCUR SHALL re-acquire the FAT and FDC after being disconnected from and then reconnected to RF cable connection.

The OCUR SHALL enter background mode when the OCUR is not streaming.

The operation of the OCUR in background mode is not defined in this document.

10.1 Card Background Mode Power Management

The minimum power requirements for Background mode SHALL include the following:

The OCUR FDC receiver circuitry SHALL be fully powered when a Card is inserted.

The Card SHALL be fully powered when present.

11 OCUR DIAGNOSTICS

The following requirements define the self-reporting diagnostic parameters that the OCUR use to identify its working state.

The OCUR SHALL be capable of performing self-diagnostics and displaying a minimum set of diagnostics via LED that includes:

- OCUR power status
- OCUR boot status
- Indication of fatal error (e.g., Checksum error)

The OCUR SHALL provide the following diagnostic information to the DRI connection [DRI] and to the CableCARD device interface [CCIF] if requested.

- OCUR power status
- OCUR boot status
- OCUR memory allocation
- Software version numbers of code in the OCUR
- Firmware version
- MAC addresses
- OCUR network addresses
- Status of FDC
- Status of FAT
- Current channel status

NOTE: These diagnostics MAY also be displayed on the LED.

The OCUR SHALL report any requested self diagnostics identified in this section to the Card through the Generic Diagnostic Support resource.

The following subsections describe the self-diagnostics parameters, specified above, that are reported to the Card and made available on the DRI connection [DRI].

11.1 Memory Resources

The OCUR SHALL be capable of reporting memory allocation results that SHALL include, but are not limited to:

- Type of memory being reported (ROM, DRAM, SRAM, Flash, and NVM)
- Physical size of memory type (in kilobytes, defined to 1024 bytes)

11.2 Software Versions

The OCUR SHALL be capable of reporting software version number results, of all available applications, that SHALL include:

- Application's name string
- Application's version number
- Software status (active, inactive or downloading)
- If applicable, Application's signature

11.3 Firmware Version (OCUR)

The OCUR SHALL be capable of reporting firmware version results that SHALL include:

- Firmware version number of entire firmware image
- Firmware's release or installation date of entire firmware image

11.4 MAC Addresses

The OCUR SHALL be capable of reporting media access control (MAC) address results that SHALL include:

- Type of devices being reported (OCUR, Card, USB, and/or Ethernet)
- NOTE: If multiple devices of the same type exist, then the MAC address for each device type SHALL be reported.
- MAC address of each reported device

11.5 OCUR Network Addresses

The OCUR SHALL be capable of reporting network address results that SHALL include:

- Network address of device
- NOTE: If multiple network addresses exist, then each network address SHALL be reported.

11.6 Status of FDC

The OCUR SHALL be capable of reporting forward data channel (FDC) status results that SHALL include:

- FDC center frequency, in MHz
- Carrier lock status (e.g., LOCKED – NOT LOCKED)

11.7 Status of FAT

The OCUR SHALL be capable of reporting forward application transport (FAT) channel status results that SHALL include:

- Modulation mode indicator; analog, 64 QAM, or 256 QAM
- Carrier lock status
- If the currently tuned channel is digital, then PCR lock status; the FAT channel tuner is locked or not locked to the currently tuned service
- Numerical estimate of the channel's signal to noise ratio in tenths of a dB
- Numerical estimate of the signal level in tenths of a dBmV

NOTE: When operated at nominal line voltage, at normal room temperature, the reported Level and SNR needs to be within 6 dBmV and 3 dB of the actual received channel level and SNR, respectively, for the input level range of -15 dBmV to +15 dBmV.

NOTE: Across the input level range from -15 dBmV to +15 dBmV, for any 1 dB change in input level or SNR, the OCUR needs to report a power change in the same direction that is not less than 0.5 dB and not more than 2.0 dB.

11.8 Current Channel Status

The OCUR SHALL be capable of reporting current channel status results that SHALL include, but are not limited to:

- Channel type; analog or digital
- Authorization status; OCUR is authorized or not authorized for currently tuned service

Purchasable status; currently tuned service may or may not be purchased

Purchased status; currently tuned service is or is not purchased

Preview status; currently tuned service is or is not in preview mode

11.9 DRM Pairing Message

The OCUR SHALL be capable of reporting its current DRM Pairing Message.

12 MECHANICAL

The OCUR SHALL be capable of dissipating the heat from a Card drawing a maximum RMS power of 1.5 watts across the CableCARD interface while satisfying the requirement of item 8 of Table 12–1.

The OCUR SHALL have a non-removable label in close proximity to the Card slot to indicate the type of Card it accepts.

This label SHALL say "M-Card Only".

The OCUR SHALL have a non-removable nameplate(s) or sticker(s) that includes the following information:

Vendor ID: 24-bit vendor ID represented as 3 bytes (6 hexadecimal digits).

This number SHOULD be assigned by OpenCable to ensure uniqueness.

Vendor Name: 40 ASCII characters maximum.

Serial Number or Serial No: 40 ASCII character maximum.

The OCUR SHALL meet all of the requirements listed in this specification without malfunction, hardware or software failures under the conditions listed in Table 12–1.

Table 12–1 - Environmental / Mechanical Requirements

	Parameter	Value	Internal HMS Device	Standalone
1.	Input Line Voltage	95 to 125 VAC		x
2.	Input Line Frequency	57 to 63 Hz		x
3.	RF Susceptibility	RF field of 2 volts/ meter from 40 MHz to 1 GHz	x	x
4.	Lightning Surge Tolerance	UL 1409 voltage surge test 38.1, UL 1449, IEEE C62.41, IEEE 587 compliant. RF Input: 1.5 kV at 1kV/usec, 60 amp peak; AC line input: 6 kV, oscillatory 0.5 µsec rise time 100 kHz.	x	x
5.	Electrostatic Discharge	IEC 801-2, withstand 10 discharges at 15 kV to each corner of the chassis, through a 150 pf capacitor in series with 150 ohm resistor, with device chassis grounded to ESD generator		x
6.	Brown Out Effects	No corruption of non-volatile memory due to input voltage fluctuations from nominal to zero volts	x	x
7.	Operating Ambient Temperature and Humidity	0° to 40°C and 5% to 95% RH non-condensing humidity	x	x
8.	External Surface Temperature (with power applied, device on, and 25°C ambient temperature)	UL 1409 compliant. No external protruding surface point hotter than 50°C for metallic and 60°C for nonmetallic surfaces. No non-accessible surface point hotter than 65°C.	x	x
9.	Storage Temperature (non-powered, non-operating)	-20° to +60°C	x	x

	Parameter	Value	Internal HMS Device	Standalone
10.	Storage Humidity (non-powered, non-operating)	5% to 95% RH non-condensing at 40°C	x	x
11.	Altitude	Operating: -150 to 10,000 ft. AMSL Storage: -150 to 15,000 ft. AMSL	x	x
12.	Thermal Shock	Device meets all operational specs after subjection to: -40°C. for 30 minutes +25°C. for 10 minute +60°C. for 30 minutes	x	x
13.	Humidity Shock	Mil-std-810d method 507.2: Device meets all operational specs after subjection to: raise temp to +60°C and 95% RH over 26 hrs., maintain for 6 hrs., drop to 85% RH while reducing temp to +30°C over 8 hrs., maintain +30°C and 95% RH for 8 hrs. Repeat for 10 cycles.	x	x
14.	Solvent Resistance	No external surface deformation effect of common household solvents, cleaners, waxes.		x
15.	Shipping Vibration	Fully operational after subjection to swept frequency vibration test applied in each of x, y, z planes with excursion of 0.3 inches at a frequency varied from 10 to 30 Hz back to 10 Hz done six times within 30 minutes.	x	x
16.	Mounting Feet	No marks or stain to varnished wooden surface after 40°C and 95% RH exposure for 10 days under force of 1.65 lbs.		x
17.	Impact Test	Device will not develop any openings creating electrical shock risks after subjection to an impact force of 5 ft. lbs. obtained from a free fall of a 2-inch diameter solid smooth steel sphere weighing 1.18 lbs.		x
18.	Handling Drop Test	Device fully operational and not develop any openings exposing risk of electrical shock after subjection to one drop on the face of the device from a height of 20 inches onto a 2-inch thick smooth surface concrete floor.		x
19.	Strain Relief Test	For permanently attached power supply cords, device will withstand steady pull force of 35 lbs. applied to the cord.		x
20.	Non-volatile Memory Life	Non-volatile memory will have a non-powered minimum life of: 1.5 yrs storage life @ 60°C or less.	x	x
21.	Microphonic Shock	Device will remain error- or interference-free (i.e., no audio pops, clicks, no data errors, no video artifacts) when subjected to tapping with a reasonable force by placing device on a hard surface without padding or mats and inducing 20 taps from knuckles, flat hands, fists, finger nails, screwdriver handles, plastic hammers to all external surfaces of the device.	x	x
22.	Physical Security/Tamper-Resistance	Secure means of evidencing entry into the security portions of the device	x	x

Annex A OCUR-HMS CONTENT PROTECTION REQUIREMENTS (normative)

When paired with a CableCARD, the OCUR SHALL output content received on the Cable Input ONLY on the DRI and consistent with the tables below.

The DRM SHALL specify usage rights (enforced pursuant to the applicable DRM compliance rules) to permit content output only as shown in the tables below.

Content Type key: A = Analog; D = Digital; S, 0, 1, 2, 3, RCD, and N summarize the values in the successive content control columns; X = ignore or don't care.

Analog TV Signals on OCUR's Cable Input						DRM License and Encryption on DRI	Internal HMS Retention Limit (min.)	Downstream Distribution from HMS of DRM-Protected Cable Content		Output of Content by Devices Downstream of OCUR																				
#	Content Type	CA Scrambled	Macrovision Encoding on Video Signal	APS ¹	CGMS-A ¹			RCD ¹	To Display Only Devices (no persistent storage)*	To External Storage Devices**	Analog Composite or Component Outputs			VGA ⁴ Max. ¹ Indicators on Analog TV input refer to APS and CGMS-A on Line 20 per [IEC 61880] and APS, CGMS-A, and RCD on Line 21 per [CEA-608]. If the input content protection indicators conflict, the OCUR SHALL apply the more restrictive value of each APS, CGMS-A and RCD.

² All analog composite or component outputs SHALL include the parameters shown encoded compliant with [CEA-608] and [IEC 61880] for RF, composite video, S-video and 480i component signals, and, compliant with [CEA-805] for 480p, 720p and 1080i component signals. Until 18 months after the Effective Date, this requirement is CONDITIONAL MANDATORY, applicable only when the graphics card includes support for "type B" packets as described in [CEA-805]. After 12 months, this requirement will be MANDATORY for HMSs manufactured with next generation graphics chipsets, and after 18 months will be MANDATORY for all HMSs.

³ Image Constraint is defined in [CCCP]. A Constrained Image can be output or displayed using video processing techniques such as line doubling or sharpening to improve the perceived quality of the image.

⁴ VGA outputs as defined in [CHILA]. Content output over VGA can be output or displayed using video processing techniques such as line doubling or sharpening to improve the perceived quality of the image.

⁵ The DTCP “EPN” bit value of zero signals Encryption Plus Non-assertion. The EPN value of one signals EPN mode inactive.

⁶ The OCUR SHALL treat all content for which it requests CA descrambling of the CableCARD as CA-Scrambled.

⁷ CCI Value per [CCCP] extended with an RCT bit #5, defined as Redistribution Control Trigger. The OCUR SHALL output content marked with RCT=1, one, only under an approved output protection method that includes proximity control.

⁸ All analog composite or component outputs SHALL include the parameters shown encoded compliant with [CEA-608] and [IEC 61880] for RF, composite video, S-video and 480i component signals, and compliant with [CEA-805] for 480p, 720p and 1080i component signals. Until 18 months after the Effective Date, this requirement is CONDITIONAL MANDATORY, applicable only when the graphics card includes support for “type B” packets as described in [CEA-805]. After 12 months, this requirement will be MANDATORY for HMSs manufactured with next generation graphics chipsets, and after 18 months will be MANDATORY for all HMSs.

⁹ Image Constraint is defined in [CCCP] and applies only to output at 720p or 1080i lines. A Constrained Image can be output or displayed using video processing techniques such as line doubling or sharpening to improve the perceived quality of the image.

¹⁰ VGA outputs as defined in [CHILA]. Content output over VGA can be output or displayed using video processing techniques such as line doubling or sharpening to improve the perceived quality of the image.

¹¹ If [SCTE 21] data is present and includes values for APS, CGMS-A, or RC, the OCUR SHALL permit the output of content only according to the values shown in the inset tables.

¹² HDCP active on digital display outputs (such as DVI, HDMI, and DisplayPort) for live or trick mode play and for playback of recorded content if any similar recorded content is HDCP protected.

* Display Only Devices, which are downstream rendering devices that are not permitted under applicable compliance rules to persistently store Cable Content, shall be subject to agreed upon proximity limits.

** External Storage Devices, which are downstream devices on which Cable Content can be stored (where permitted under applicable compliance rules) and played back, shall be subject to agreed upon proximity limits (when obtaining content) and limited to Standard Definition.

Annex B Mechanism for DRM revocation

Annex B defines a mechanism to send SRMs (System Renewability Messages) to the OCUR device for the purpose of revoking or reinstating one or more DRM systems. Leveraging the [OC-CD] and [OC-SEC] specifications, it defines the format of the SRM messages and how they are included into files that are downloaded to the OCUR.

To support code upgrade verification, the OCUR SHALL be loaded at manufacturing time with the following parameters:

OCUR Manufacturer's organizationName

Manufacturer's CVC validity start time (ValidityNotBefore) as the cvcAccessStart value

The date and time of 12:00:00AM on 1/1/2006 as the srmAccessStart value.

The OCUR SHALL process the downloaded files based on their file name extension as provided by the Code Version Table (CVT) described in Table 9.19-5 of the [CCIF] specification and Table B-1.

Upon receiving a CVT, the OCUR SHALL overwrite the cvcAccessStart value stored in the non-volatile memory with the value of the CVC validity start time (ValidityNotBefore), if all the following conditions are met:

The CVC Subject organizationName is same as the OCUR manufacturer's organizationName stored in the OCUR;

The CVC ValidityNotBefore parameter is newer than the cvcAccessStart value currently stored in the OCUR;

The CVC is chained to the OCUR CVC CA stored in the OCUR.

Table B-1 - Code File Naming

Name	Description
<download file name>.SRM	File that contains only one SRM (as part of the SignedContent), but not a CodeImage for download
< download file name>.IMAGE	File that contains only an OCUR code image for download, but not an SRM
< download file name>.BOTH	File that contains both an SRM (as part of SignedContent) and an OCUR code image for download

B.1 Download File Structure

The Download File SHALL consist of one or two PKCS #7 compliant sections as defined in Table B-2.

Table B-2 - Download File PKCS #7 section format

Code File	Description
PKCS #7 Digital Signature {	
ContentInfo	
ContentType	SignedData
SignedData ()	EXPLICIT signed-data content value: includes CVS and X.509 compliant CVCs
} end PKCS #7 Digital Signature	
SignedContent {	
DownloadParameters {	Mandatory TLV format (Type 28). (Length is zero if there is no sub-TLVs.)
Srm()	Optional TLV for MSO System Renewability Message TLV format 200. Refer to Section B.3.1.
MfgCACerts ()	Optional TLV for one or more DER-encoded CableLabs Manufacturer CA Certificate(s) each formatted according to CableLabs Device CA-Certificate TLV format (Type 17) Refer to Section B.3.2.
clabCVCRootCACert()	Optional TLV for one DER-encoded certificate formatted according to the CableLabs CVC Root CA CA-Certificate TLV format (Type 51). Refer to Section B.3.3.
clabOCURCVCCACertificate ()	Optional TLV for one DER-encoded certificate formatted according to the CableLabs OCUR CVC CA-Certificate TLV format (Type 52). Refer to Section B.3.4.
}	

Code File	Description
CodeImage ()	Optional Upgrade code image.
} end SignedContent	

B.2 Signed Data

If the download file name extension is SRM, the OCUR SHALL verify that the CableLabs Code Verification Certificate is available in the Signed Data field defined in Table B-3.

If the download file name extension is IMAGE, the OCUR SHALL verify that the Vendor Code Verification Certificate is available in the Signed Data field defined in Table B-3 before parsing the SignedContent section.

If the download file name extension is BOTH, the OCUR SHALL verify that the CableLabs Code Verification Certificate is available in the Signed Data field of the first PKCS#7 structure as defined in Table B-3 and that the Vendor Code Verification Certificate is available in the Signed Data field of the first PKCS#7 structure as defined in Table B-3.

Table B-3 - PKCS #7 Signed Data

PKCS #7 Field	Description
SignedData {	
Version	version = 1
DigestAlgorithmIdentifiers	SHA-1
ContentInfo	
ContentType	data (SignedContent is concatenated at the end of the PKCS #7 structure)
certificates {	CableLabs Code Verification Certificates
SignerCVC	(REQUIRED for all code files)
Co-signerCVC	(OPTIONAL; required for co-signatures)
} end certificates	
SignerInfo {	
SignerInfo {	(REQUIRED for all code images/SRMs)
Version	version = 1
IssuerAndSerialNumber	
IssuerName	
CountryName	US
OrganizationName	CableLabs
CommonName	CableLabs OCUR CVC CA
CertificateSerialNumber	<Signer CVC serial number>
DigestAlgorithm	SHA-1
AuthenticatedAttributes	
ContentType	data (contentType of signedContent)
SigningTime	UTC Time (GMT), YYMMDDHHMMSSZ
MessageDigest	Digest of the content as defined in PKCS #7
DigestEncryptionAlgorithm	RsaEncryption
EncryptedDigest	
} end mfg signer info	
CoSignerInfo {	(OPTIONAL; required for co-signatures)
Version	version = 1
IssuerAndSerialNumber	
IssuerName	
CountryName	US
OrganizationName	CableLabs
CommonName	CableLabs OCUR CVC CA
CertificateSerialNumber	<CoSigner CVC serial number>
DigestAlgorithm	SHA-1
AuthenticatedAttributes	
ContentType	data (contentType of signedContent)
SigningTime	UTC Time (GMT), YYMMDDHHMMSSZ
MessageDigest	Digest of the content as defined in PKCS #7
DigestEncryptionAlgorithm	RsaEncryption
EncryptedDigest	
} end CoSignerInfo	
} end SignerInfo	

PKCS #7 Field	Description
} end SignedData	

B.3 Signed Content

Signed Content section of the PKCS#7 structure is defined in Table B–2.

Upon receiving a PKCS#7 structure, the OCUR SHALL overwrite the `cvcAccessStart` stored in non-volatile memory with the CVC validity start time (`ValidityNotBefore`), if all the following conditions are met:

The CVC Subject `organizationName` is the same as the OCUR manufacturer's `organizationName` stored in the OCUR

The CVC `ValidityNotBefore` parameter is newer than the `cvcAccessStart` value currently stored in the OCUR

The CVC is chained to the OCUR CVC CA stored in the OCUR.

Upon receiving a PKCS#7 structure, the OCUR device SHALL load the included firmware image and self reboot, if all the following conditions are met:

The Signer CVC `organizationName` matches the manufacturer's `organizationName` stored in the OCUR

The Signer CVC validity start time (`ValidityNotBefore`) is equal to or greater than the `cvcAccessStart` parameter stored in the OCUR

The PKCS #7 `SigningTime` is equal to or greater than the Signer CVC validity start time (`ValidityNotBefore`)

The PKCS #7 `SigningTime` is equal to or less than the Signer CVC validity end time (`ValidityNotAfter`)

The Signer CVC is chained to the OCUR CVC CA stored in the OCUR

The `SignedContent()` is properly signed

The `CodeImage()` is appropriate for the current device hardware and firmware version; this verification is manufacturer specific.

B.3.1 Srm ()

SRM Format

For DRM revocation (or removal from revocation list), the SRM SHALL have the format defined in Table B–4.

Upon receipt of a PKCS #7, the OCUR SHALL overwrite the `srnAccessStart` value stored in the non-volatile memory with the CableLabs CVC validity start time (`ValidityNotBefore`), if all the following conditions are met:

The CVC Subject `organizationName` matches CableLab's `organizationName` stored in the OCUR

The CVC validity start time (`ValidityNotBefore`) is newer than the `srnAccessStart` value currently stored in the OCUR

The CVC is chained to the CableLabs CVC Root CA stored in the OCUR.

Upon reception of a PKCS#7 structure, the OCUR device SHALL validate an SRM object if all the following conditions are met:

The Signer CVC `organizationName` matches the CableLabs `organizationName` stored in the OCUR

The Signer CVC validity start time (`ValidityNotBefore`) is equal or greater than the `srnAccessStart` parameter stored in the OCUR

The PKCS #7 `SigningTime` is equal or greater than the Signer CVC validity start time (`ValidityNotBefore`)

The PKCS #7 `SigningTime` is equal or less than the Signer CVC validity end time (`ValidityNotAfter`)

The Signer CVC is chained to the OCUR CVC CA stored in the OCUR

The `SignedContent()` is properly signed.

Table B-4 - SRM Structure

Syntax	# of bits	Description
<pre>Srm() { number_of_DRMs issue_date for (i=0;i<number_of_DRMs;i++) { drm_guid revocation_status } }</pre>	<p>8</p> <p>32</p> <p>128</p> <p>8</p>	<p>Number of DRMs listed in this SRM</p> <p>Unsigned integer quantity representing the current system time as the number of seconds since 12 AM, January 6, 1980.</p> <p>Global Unique Identifier for the DRM system</p> <p>revocation_status: 0x00 Not revoked 0x01 Revoked</p>

B.3.2 MfgCACerts()

CableLabs Device CA-Certificate TLV Format

The attribute is a string attribute containing an X.509 CA Certificate, as defined in [OC-SEC].

Type	Length	Value
17	Variable	X.509 CableLabs Device CA Certificate (DER-encoded ASN.1)

B.3.3 clabCVCRootCACert()

CVC Root CA CA-Certificate TLV Format

The attribute is a string attribute containing an X.509 CA Certificate, as defined in [OC-SEC].

Type	Length	Value
51	Variable	X.509 CableLabs CVC Root CA Certificate (DER-encoded ASN.1)

B.3.4 clabOCURCVCCACertificate()

CVC CA-Certificate TLV Format

The attribute is a string attribute containing an X.509 CA Certificate, as defined in [OC-SEC].

Type	Length	Value
52	Variable	X.509 CableLabs CVC CA Certificate (DER-encoded ASN.1)

Upon reception (in a download file with a file name extension of either SRM or BOTH) of a validated SRM that includes an srm() download parameter, the OCUR SHALL update the Drm_revocation_list.

Upon reception (in a download file with a file name extension of either SRM or BOTH) of a validated SRM that includes one or both of the following two download parameters: clabCVCRootCACert(), or clabOCURCVCCACertificate(), the OCUR SHALL replace the CableLabs CVC Root CA or the CableLabs OCUR CVC CA Certificate(s) currently stored in the OCUR.

If the download file name extension is IMAGE and a CodeImage is available, the OCUR SHALL validate and install the image as described in B.3.

If the download file name extension is BOTH and a CodeImage is present in the second PKCS#7 structure, the OCUR SHALL validate and install the image as described in B.3.

Each manufacturer should build their code with additional mechanisms that verify an upgrade code image is compatible with the destination OCUR.

Appendix I Revision History

The following ECN was incorporated into version I02 of this specification:

Identifier	Description	Date Accepted
OCUR-N-06.0867-1	OCUR Omnibus	2/3/06

The following ECN was incorporated into version I03 of this specification:

Identifier	Description	Date Accepted
OCUR-N-06.0877-4	Modify Annex A to reflect RCD bit of XDS on Analog TV Signals and define ENR in place of EPN	3/30/06

The following ECN was incorporated into version I04 of this specification:

Identifier	Description	Date Accepted
OCUR-N-06.0901-4	Modify Annex B to specify CVT delivered CVC	6/9/06

The following ECN was incorporated into version I05 of this specification:

Identifier	Description	Date Accepted
OCUR-N-06.0922-1	Transport_error_indicator set by OCUR	8/25/06

The following ECN was incorporated into version I06 of this specification:

Identifier	Description	Date Accepted
OCUR-N-07.1077-3	M-CARD extension	10/5/07

The following ECN was incorporated into version I07 of this specification:

Identifier	Description	Date Accepted
OCUR-N-08.1246-1	Remove Requirement to Protect Output of Content with No Protection Flags	5/30/08

The following ECN was incorporated into version I08 of this specification:

Identifier	Description	Date Accepted
OCUR-N-08.1194-2	Mandate M-mode only in OCUR devices	5/30/08

The following ECN was incorporated into version I09 of this specification:

Identifier	Description	Date Accepted
OCUR-N-10.1533-1	Change analog channel support from mandatory to optional	3/19/10

The following ECN was incorporated into version I10 of this specification:

Identifier	Description	Date Accepted
OCUR-N-10.1571-2	Allowed interfaces/multiple interfaces on OCUR devices	8/13/10

The following ECNs were incorporated into version I11 of this specification:

Identifier	Author	Date Accepted	Description
OCUR-N-12.1788-1	Kotz	5/18/12	Clarification to allow HDCP output on digital outputs other than DVI and HDMI
OCUR-N-12.1810-1	Richardson	2/8/13	Remove Profile 6 from OCUR requirement
